1. Introduction

Historic bridges are an important part of Louisiana's culture and transportation history. To preserve and protect this legacy, a statewide Historic Bridge Inventory project was undertaken by the Louisiana Department of Transportation and Development (LADOTD), in cooperation with the Federal Highway Administration (FHWA) and the State Historic Preservation Office (SHPO). Representatives of these three agencies served as members of the Historic Bridge Inventory Committee, providing direction to the project team and review of interim and final work products. The population of bridges subject to this inventory is those built before 1971 that are owned by state, federal, or local entities with certain exclusions (referred to as subject population, with "pre-1971" as the subject period).[1]

This *National Register Eligibility Determination Report* presents the results of the evaluation of the eligibility of pre-1971 bridges for listing in the National Register of Historic Places (National Register). As a result of the evaluation, each bridge in the subject population has been determined either eligible or not eligible for listing in the National Register. Eligibility recommendations were made by historians meeting the Secretary of the Interior's professional qualification standards, which meet federal requirements for such decision-making. These results were reviewed by the Historic Bridge Inventory Committee. Final determinations were made by the FHWA, in consultation with LADOTD, and received concurrence from SHPO.

Results presented in this *National Register Eligibility Determination Report* will facilitate LADOTD and FHWA compliance with federal laws and regulations that affect historic properties, including bridges. These include the National Historic Preservation Act (NHPA) of 1966, which requires agencies implementing projects utilizing federal funding to identify potentially affected historic properties, consider ways to avoid or minimize adverse effects, and mitigate any adverse effects. The ultimate goal of this project is to identify historically significant bridges suitable for preservation, and to develop a process for their management and preservation.

To present and support the results of the National Register eligibility evaluation effort, this report includes the following components:

- A historical overview of important legislation, policies, and trends related to Louisiana's bridge construction.
- The methodology used to identify bridges for evaluation, determine data collection needs, and collect data needed to evaluate National Register eligibility.
- An overview of the criteria used to evaluate eligibility for National Register listing.

[1] Bridges located at state borders with Texas and Mississippi, for which LADOTD shares responsibility with neighboring states, are also included. Non-bridge types (such as pedestrian walkways and ferries), and bridges that are a part of the Interstate System are excluded from the subject population.

- A description of how historic and engineering significance is determined under applicable National Register criteria.

- A description of how historic integrity is evaluated under applicable National Register criteria.

- Eligibility results, including bridges eligible under *Criterion A* by area of historic significance and bridges eligible under *Criterion C* by bridge type.

.

2. Historical Overview

Louisiana contains more than 66,000 miles of waterways, 1,600 square miles of lakes and reservoirs, and 10 major navigation canals. The obstacles posed by these natural and engineered features resulted in bridges playing a key role in the state's built environment. To evaluate the significance of a bridge requires an understanding of associated historic contexts. This historical overview provides the framework to understand the events, themes, trends, and advances associated with the development of the state's transportation network. Knowledge of these contexts allows the historian, in evaluating a bridge's eligibility for listing in the National Register, to understand how a bridge may illustrate important aspects of history and/or engineering. Section 5 provides the areas of significance that specifically relate to Louisiana bridges. For a more in-depth presentation of these important events and trends, see the *Historic Context for Louisiana Historic Bridge Inventory* (Mead & Hunt, Inc., 2012). The following timeline from that report is provided as a reference to key events in Louisiana history.

Timeline of Historical Events

- *1803: Louisiana Purchase*
- *1812: Louisiana statehood*
- *1860-1865: U.S. Civil War*
- *1850s-1890s: Railroad era*
- *1896: Rural Free Delivery Service established*
- *By 1900: Good Roads Movement had begun*
- *1909: National Good Roads Association meeting in New Orleans*
- *1910: State Highway Department and Board of State Engineers created*
- *1910s: Early transcontinental highways established*
- *1916: Federal-Aid Highway Act of 1916*
- *1917-1918: American involvement in World War I*
- *1921: Federal-Aid Highway Act of 1921*
- *1921: New State Constitution*
- *1921: Louisiana Highway Commission (LHC) created*
- *1927: Great Mississippi Flood*
- *1928: Huey Long elected Governor*
- *1928: Reorganization of the LHC*
- *1928: State Constitution amended to allow the issue of construction bonds*
- *1929: Stock market crash and beginning of the Great Depression*
- *1930: $75 million bond authorized for the construction of roads and bridges*
- *1933: Roosevelt Administration and the New Deal implemented*
- *1935: Assassination of Huey Long*
- *1935: Mississippi River Bridge at New Orleans completed*
- *1940: Mississippi River Bridge at Baton Rouge completed*
- *1940: Department of Highways reorganized*
- *1941-1945: American involvement in World War II*
- *1944: Federal Aid Highway Act of 1944*

- *1952: Mississippi River Bridge Authority established to oversee financing, construction, and maintenance of the Crescent City Connection (Greater New Orleans Bridge)*
- *1956: Federal Aid Highway Act of 1956*
- *1956: Lake Pontchartrain Causeway completed*
- *1958: Crescent City Connection (Greater New Orleans Bridge) completed*
- *1976: Louisiana Department of Transportation and Development established*

The state's early transportation history centered largely on water-based routes, taking advantage of the extensive natural wetlands, marshes, swamps, bayous, rivers, and estuaries.[2] As a result, early farms and plantations were typically sited near navigable waterways. These waterways, however, presented an ongoing challenge in the development of overland travel routes. As a result, improved roadways that existed during the late nineteenth and early twentieth centuries were typically discontinuous farm-to-market routes, with water crossing typically accomplished by boat or ferry.

By the late 1800s various groups began to promote the construction of dependable, year-round roadways in Louisiana and throughout the U.S. As bicycle touring gained popularity in the 1880s and 1890s, enthusiasts began to demand hard-surfaced thoroughfares to pursue the pastime. Near the turn of the century, the federal Rural Free Delivery mail system was introduced, which also required a network of dependable roads to serve rural areas. As automobile use gained popularity in the early 1900s, thousands of citizens had a vested interest in passable roads and highways. The rapid expansion of the automobile's use led to a national effort to enlarge and improve the country's highway system that became known as the Good Roads Movement.

As early as 1909 Louisiana began a road construction initiative, extending state aid to parishes for road construction. In this same year, state road supporters convened in New Orleans for the National Good Roads Association meeting. In his address to the convention, Governor Jared Sanders inaugurated the age of Good Roads in Louisiana, highlighting the construction of the Baton Rouge-New Orleans Road (later the Airline Highway) that would be completed in 1910. By this time Louisiana had an estimated 25,000 miles of roads mostly unpaved and better suited to horses and livestock than to the recently introduced pneumatic tire. No continuous road of any type connected the northern and southern portions of the state or the eastern and western regions. In 1911 Louisiana began to establish a statewide "market highway" system, designating 5,000 miles of existing routes for improvement. The State Highway Department (SHD), predecessor to the Louisiana Highway Commission (LHC) and later the Louisiana Department of Highways (LDH)[3], was created to manage this initiative and charged with establishing a state highway system by furnishing plans and specifications for road and bridge construction.

Nationally, the Good Roads Movement spurred the establishment of named transcontinental highways prior to World War I. Road promoter Carl Fisher encouraged new hard-surfaced transcontinental

[2] With 7,800 square miles of coastal swamps, bayous, marshes, and estuaries, Louisiana contains more than 40 percent of all wetlands in the U.S.

[3] The Louisiana Highway Commission (LHC) was reorganized in 1940 and became the Louisiana Department of Highways (LDH).

highways, such as the Lincoln and Dixie Highways, as ideal ways to demonstrate the effectiveness of new paving methods, better engineering, and uniform signage. Early transcontinental highways that crossed through Louisiana included the Dixie Overland Highway, which transects the state from east to west along its northern edge, connecting Savannah, Georgia, with San Diego, California; and the Old Spanish Trail, which crosses the state in a similar route along the southern coast, connecting St. Augustine, Florida, with San Diego, California. Another early road being promoted was the Jefferson Highway, which enters the state in the north and roughly follows the Mississippi River to New Orleans, connecting New Orleans to Winnipeg, Canada. These highway corridors, established between 1914 and 1919, served as the inspiration for future routes in the state and were later integrated into the U.S. Highway system.

Public demand for highway improvements, as initiated with the Good Roads Movement, were answered in the Federal-Aid Road Act of 1916, a revenue-sharing program that marked the first time the federal government was directly involved in state road building. Federal funding continued with the passage of the Federal Highway Act of 1921, which required states to designate a portion of their roads for the national highway system, and assume responsibility for road maintenance, previously the responsibility of local units of government.

In Louisiana, the new State Constitution, ratified in 1921, outlined 98 automobile highway routes in the state totaling 7,000 miles and charged the LHC with constructing and maintaining them. The state, also through the new constitution, authorized a tax from automobile licensing and gasoline sales to help provide additional revenue to the LHC. The gasoline tax was to be used for maintenance of roads and the licensing tax for the purposes of construction. The first extensive biennial report of the LHC from 1922-1924 refers to the state's excellent results and success in administering federal aid and establishing a statewide transportation program. The state also took over maintenance responsibility of the state highways from the parishes. As such, 1921 marked a pivotal year for establishing transportation funding and policy.

The evolution of the state's road system over the early decades of the twentieth century is reflected in 13 routes established through local and state efforts between 1900 and 1930. The first important vehicular routes included the River Road, developed along the Mississippi River, and early named highways that were a direct result of the Good Roads Movement, such as the Jefferson Highway, Old Spanish Trail, and Dixieland Overland Highway. From the late 1910s through the 1930s, state and U.S. Highways were designated and established as the LHC assumed responsibility for state routes and a portion of the state's roads were designated as part of the national highway system. These routes are summarized in Table 1.

Table 1. Historic transportation routes

Historic Route	Current Route Name
River Road	River Road
Jefferson Highway	Portions of State Route (LA) 1 and U.S. Highway (US) 71
Old Spanish Trail	Portions of LA 182 and US 90
Dixieland Overland Highway	Portions of LA 4 and US 80

Table 1. Historic transportation routes

Historic Route	Current Route Name
LA 10	Portions of various state highways
US 11	US 11
US 51	US 51
Airline Highway	Portions of US 61
Chef Menteur Highway	Portions of LA 2, LA 3052, and US 90
Lone State Route	Portions of US 165
Pershing Highway	Portions of LA 26 and US 167
US 190	US 190
Beauregard Highway	Portions of US 171

The construction of bridges was integral to the state's improved transportation routes. The new State Constitution required the State Legislature to provide for the building of bridges over navigable streams using current revenues. Also in 1921, Act 95 created the LHC, replacing the earlier SHD. Recognizing the importance of bridge maintenance and construction, the LHC established its first Bridge Department, hiring Indiana engineer Norman E. Lant in 1922. Lant qualified for the position, in part, because of his studies in geology that dealt with saturated soil. Under Lant, the LHC Bridge Department employed many distinguished bridge engineers instrumental in making a connected state highway system a reality.

Throughout the 1920s the LHC Bridge Department worked to overcome the multiple challenges the state's vast waterways presented. The department prepared standard plans for timber, steel, and concrete structures, but also designed special plans for specific projects. To enhance safety, the department designed and constructed numerous grade separation structures to separate auto and railroad traffic at dangerous intersections across the state. Early grade separation structures were constructed in 1927 in Caddo Parish (Recall No. 013480) and LaSalle Parish in 1932 (Recall No. 049130).

After the Great Flood of 1927, which was one of the most widespread natural disasters of the century, the LHC Bridge Department had to repair and replace many flood-damaged structures. When Governor Huey Long took office in 1928, the state was still in recovery mode. Responding to the challenge, Long strengthened the LHC and introduced state bonding to fund an ambitious road and bridge construction program. Long's populist-inspired plan proved to be a state-level solution to the Great Depression, which was soon to follow, creating hundreds of jobs that helped keep Louisiana families financially afloat. By 1931 the department was involved in 15 major bridge projects across Louisiana, including the Mississippi River Bridges at New Orleans (Recall No. 000060) and Baton Rouge (Recall No. 051880). Both bridges, later to be named for Long, began as state efforts but were finished with federal support in 1936 and 1939, respectively. In the 1930s the LHC undertook an effort to upgrade US 90 (Old Spanish Trail), an integral part of the Rigolets to Pearlington shortcut between Louisiana and the Mississippi Gulf Coast, and to eliminate all ferry crossings along the route. The 1933 US 90 Bridge over the East Pearl River (Recall No. 058750) provided the final link in this 22-mile shortcut.

Federal job-creation efforts in the form of New Deal programs initiated by President Franklin Roosevelt also had a significant impact on Louisiana's infrastructure development during the 1930s. Important New Deal agencies that funded road and bridge construction included the Civilian Conservation Corps (CCC), Civil Works Administration (CWA), Public Works Administration (PWA), and Works Projects Administration (WPA). Increased attention was given to creating grade separations between railway lines and roads, and specific legislation was passed to provide funds for highway-rail grade separations through the National Industrial Recovery Act (NIRA) (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). Examples such as the Perkins Road Overpass in Baton Rouge (Recall No. 610023), were built in several parishes from 1935 to 1939 with funding provided by the U.S. Works Program Grade Crossing program.[4] Bridge construction was also part of federal-relief efforts by the WPA, PWA, CWA, and Federal Emergency Relief Administration (FERA) in New Orleans's City Park. These efforts included the reconfiguration of the park layout; landscaping; and sidewalk, road, bridge, and building construction. Between 1936 and 1939 the WPA constructed eight reinforced concrete arch bridges and one rigid frame bridge in City Park featuring Classical Revival and Art Deco stylized influences typical of the period.[5]

The Long era witnessed a boom in infrastructure construction, carried out through the various New Deal work relief programs and even continuing for a few years after his death in 1935. In the early 1940s the U.S. became involved in World War II and the programs were discontinued. With the shift to the war effort, labor and materials became scarce and funding for infrastructure was reduced. The LHC, reorganized as the LDH, faced a limited budget due to reduced gasoline tax collections. During this period, the LDH focused on federally funded defense-related road improvements and planned for postwar projects. Very few bridges were constructed during the war.

In the 1940s the U.S. War Department began diverting water from the Mississippi River into the Atchafalaya River to prevent flooding of the lower reaches of the Mississippi River. The diversion channels and floodplains extended across existing state highways and prevented vehicular use during periods of flooding. At the request of the federal government, the LDH initiated improvements to the affected highways with high-level bridges that spanned the floodplain on a long series of piers. The Morganza Floodway Bridge (Recall No. 054830) was one such bridge. Completed in 1945, the bridge provided uninterrupted access over the Morganza floodplain.

Following World War II the federal government began to focus on provision of an Interstate Highway system, first establishing the need and vision and then providing funding through a series of legislative acts. President Roosevelt had appointed a committee in 1941 to analyze the need for a national expressway system. In 1944, behind Roosevelt's endorsement, the first Federal-Aid Highway Act was passed that called for a nationwide system comprised of 40,000 miles of limited access highways. Finally, in 1956 a subsequent Federal-Aid Highway Act provided sufficient funding to begin construction of a national system of Interstate highways. The 1956 legislation also authorized an initial 13-year

[4] Seven examples in the subject population were directly tied to this program. They are Recall Nos. 023620, 059090, 055130, 015500, 19040, 059730, and 610023.

[5] Recall Nos. for New Orleans City Park bridges are 102114, 102115, 102235, 102236, 102337, 102113, 102233, 102226, 102234.

construction period for Interstate highways, which would eventually be extended as states faced routing and funding difficulties.

In Louisiana the postwar era inaugurated an economic boom, with new industries attracted by the state's natural resources which brought new jobs. As vehicle registrations tripled between 1947 and 1965, economic growth and government funding combined to support a vastly improved statewide network of roadways and bridges. As an indication of the level of construction activity during this period, the LDH built 140 bridges between 1948 and 1949 alone. An example is the Warren truss bridge over the Calcasieu River in Calcasieu Parish (Recall No. 032780), underway in 1948-1949 and completed in 1951.

In Louisiana, the LDH biennial reports from the 1950s and 1960s tell a story of exponential expansion after the pause of the war years. A rapid pace of bridge building was accomplished, in part, by utilizing engineering consultants specializing in new methods of bridge design. Of particular note are the contributions of New York City based Modjeski and Masters, which opened a Baton Rouge office in 1947. Modjeski and Masters completed the design and construction of the new Greater New Orleans Bridge over the Mississippi River Bridge in 1957, later known as the Crescent City Connection (Recall No. 200790, exempt from Section 106 as an Interstate bridge). Originally designed as a toll bridge carrying US 90, the Crescent City Connection linked downtown New Orleans with the growing west bank area while relieving the earlier Huey P. Long Bridge (Recall No. 000060), completed in 1936.[6]

Bridge construction during this period also included projects by the LDH, which completed the first vehicular crossing of the Red River approximately 23 miles north of Shreveport (Recall No. 012548) in 1952, eliminating a ferry crossing and providing for uninterrupted east-west travel on LA 2 through the northern portion of Louisiana. Other projects included additional flood control improvements, such as the Old River Control Structure with its canal and two spillways built in the late 1950s as part of a conservation effort to manage flooding on the Mississippi River.[7] The associated Old River Navigation Canal provided passage of waterway traffic between the Mississippi River and the Atchafalaya River. A 1964 bridge (Recall No. 054900) carries LA 15 over the canal, raising vertically to provide necessary navigational clearance. Another state bridge project related to flood management was the series of six high-level bridges, built in three pairs in the 1960s over the West Atchafalaya Floodway to carry vehicles over the floodplain.[8]

The Lake Pontchartrain Causeway near New Orleans was a tremendous engineering accomplishment as it spanned 24 miles over wide expanses of open water. Its piers used prestressed cylindrical piles, first driven experimentally in New York in 1948 and used in the Gulf of Mexico offshore oil industry, before being employed to construct the causeway, which was completed in 1957.[9] At the time, it was the longest precast, prestressed concrete bridge crossing in the world. Other important bridges were built to address

[6] The Huey P. Long Bridge was dedicated as a National Historic Civil Engineering Landmark in September 2012 and was previously determined eligible for the National Register.

[7] The spillways include bridges with Recall Nos. F15771 and F15321.

[8] One original pair of bridges remains (Recall Nos. 007300 and 007310); the other two pairs were replaced in 2004-2005.

[9] Recall Nos. 203830 and 203832; previously determined eligible.

engineering challenges associated with the state's distinctive geography and many navigable waterways. Louisiana bridge engineers utilized a variety of bridge types prevalent nationally and others uniquely suited to Louisiana. Section 7 presents the significant bridge types and subtypes that represent the state's bridge engineering heritage.

The industrial and economic boom that began after World War II and continued through the 1960s resulted in the overall modernization of the state's roads and bridges. By 1970 the state boasted a modern highway network with major river crossings, modern interchanges, and miles of interconnected highways, including a portion of the U.S. Interstate Highway system. Also in this period, professionalism became firmly established in the LDH, with the state developing a staff of engineers, inspectors, and other professionals possessing special knowledge and skills. New federal and state statutes put an increased focus on safety, requiring transportation facilities to be constructed to modern design standards. Plans and specifications for each project were approved by the LDH and the FHWA, which provided federal oversight.

THIS PAGE INTENTIONALLY LEFT BLANK

3. Historic Bridge Inventory Methodology

This section presents the approach used to inventory bridges for the purpose of determining their National Register eligibility. Several interim reports provide details of this methodology (see list in Appendix A). The primary activities were to:

- Identify bridges within the subject population.
- Develop a context for understanding bridges.
- Determine data needed to evaluate National Register eligibility.
- Collect data for individual bridges.
- Review and analyze data to make eligibility recommendations.

A. Research and context development

The *Historic Context for Louisiana Historic Bridge Inventory* is based on historical research into both broad and specific events and trends in bridge design and construction. An overview of key aspects of the context is presented in Section 2. Preparation of the context involved the following activities:

- Literature review, including LADOTD and predecessor entity reports, design manuals, engineering journals, bridge plans, and SHPO historic bridge records.
- Statewide public meetings and outreach mailings to solicit comments and information about bridges that may be important.
- Oral history interviews with bridge engineers and transportation historians with knowledge of bridge-building in Louisiana during the subject period.
- Identification of historic Louisiana highway routes to assist in evaluating the significance of bridges associated with the routes.
- Analysis of bridge types as found in the LADOTD's Master Structure File (MSF) and the FHWA's National Bridge Inventory (NBI).

B. Data collection and analysis

A Historic Bridge Inventory database was compiled as a means to collect and sort data for bridges in the subject population. Information included in the LADOTD's MSF and the FHWA's NBI provided the initial data for each bridge. Individual bridge records were expanded to include data collected through this project.

An early effort to sort data involved removing bridges from the subject population due to exclusions.[10] A list of pre-1971 bridges excluded from inventory is included in Appendix B of this report. Table 2 shows the various bridge types that are extant in the pre-1971 bridge population, and the percent of each type within this pool. Types presented use a commonly accepted bridge typology that identifies major types and associated subtypes.[11]

Table 2. Bridges within the subject population

Bridge Type	Bridge Subtype(s)	Percent within subject population
Concrete arch	N/A	Less than 1%
Concrete beam and girder (pre-1946)	Slab	Less than 1%
	Deck girder	2%
Concrete rigid frame	N/A	Less than 1%
Culvert (pre-1946)	Concrete	5%
	Multi-plate arch	Less than 1%
Movable	Swing	1%
	Vertical lift	Less than 1%
	Bascule	Less than 1%
	Pontoon swing	Less than 1%
Steel beam and girder (pre-1946)	I-beam	Less than 1%
	Plate girder	Less than 1%
	Removable	Less than 1%
Timber	Trestle and mud sill	24%
Truss	Pony	Less than 1%
	Through	Less than 1%
Common types (post-1945)	N/A	65%
Total		**100%**

A preliminary screening of the subject population was conducted to identify bridges with and without potential significance. This evaluation included:

- Analysis of bridge data from the MSF and NBI, including information on structure type, construction date, rehabilitation information, and special engineering and/or other features.

- Review of select bridge inspection files, plans, and photos to identify bridges having physical attributes with possible importance in engineering or significant historic association.

[10] Exclusions are identified in the *Bridge Stratification and Data Collection Methodology*, December 2012.

[11] The MSF uses particular bridge type coding based on a combination of material and structural characteristics; the NBI uses a similar coding. That coding is well-suited to an engineer's task of inspecting and rating the condition of a bridge. The typology used for this report does not conflict with either of these coding methods but is better suited for the historian's purpose of evaluating National Register eligibility.

- Review of standard plans to assist in identifying bridges that might display a standardized design.

- Review of local research in selected parishes.[12]

Data collected was compiled into the Historic Bridge Inventory database. Based on the preliminary screening, bridges that lacked features, attributes, or associations that could potentially convey historical, engineering, or architectural/aesthetic significance were removed from further consideration. The Historic Bridge Inventory Committee provided its preliminary agreement that these bridges be considered not eligible for the National Register. Official concurrence was obtained as part of the complete eligibility determinations documented in this report. This process allowed subsequent data collection to focus on bridges having a reasonable potential for National Register eligibility.

For the remaining bridges, which either had the potential to possess historical, engineering, or architectural/aesthetic significance or required further information for evaluation, field survey was conducted. During field survey, aesthetic treatments, visible special features not identified during review of available data, and alterations that could affect historic integrity were documented. A field survey form was prepared for each bridge showing physical attributes (such as main span type), and engineering features or historical associations that could qualify the bridge for National Register eligibility. Historians reviewed and verified information on the field survey form for each bridge in the field to the extent possible based on visual observation. Photographs were taken and descriptive information was then recorded to assist with the future assessment of National Register eligibility by qualified historians.

Before and after field survey, supplementary research was conducted to identify important aspects of local history related to a specific bridge, as well as trends and patterns applicable to certain bridge categories on a statewide basis. Movable and truss bridges in particular were subject to detailed research to better understand their use in Louisiana. Local research was also used in certain cases to determine dates, designers, and builders. When needed, and where plans were available, historians reviewed bridge plans to confirm methods of construction, engineering features, and alterations. Engineers were consulted as needed to confirm features and plan details. This data collection provided historians with the information needed to evaluate the potential significance of each bridge.

[12] Parishes were prioritized for data collection based on the number of locally owned bridges. Local research was conducted at these parishes: Caddo, Calcasieu, East Baton Rouge, Jefferson, Jefferson Davis, Lafourche, Ouachita, Orleans, Rapides, Richland, St. Tammany, Terrebonne, Vermillion, Vernon, and Winn.

4. National Register Criteria Overview

This section provides a brief overview of the process and criteria that are applied to evaluate National Register eligibility. The process was established under the *Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation*, including the *Standards and Guidelines for Evaluation* (1983, as amended). The Section 106 regulations (36 CFR Part 800) set out a specific process for determining the National Register eligibility of properties that may be affected by a federal undertaking (see 800.4(c)). Federal agencies are required to apply the National Register criteria to properties not previously evaluated.

The National Register bulletin series provides guidance on evaluating and documenting the eligibility of historic properties. Two key bulletins are:

- *National Register Bulletin: How to Apply the National Register Criteria for Evaluation*
- *National Register Bulletin: How to Complete the National Register Registration Form*

A general requirement of the National Register provides for a property to be at least 50 years in age before its potential for historic significance is evaluated. Because LADOTD bridge projects often take many years to plan and develop, it is useful for the agency to have an eligibility determination for bridges that will reach 50 years in age by the time of project implementation. For this reason, bridges built through 1970 are included in the subject population. Properties less than 50 years of age must be exceptionally important to be considered eligible for listing. During review of eligibility recommendations, the Historic Bridge Inventory Committee agreed that certain bridges were eligible for the purposes of Section 106, and met the criteria to be eligible even though they are less than 50 years old. The FHWA determined these bridges to be eligible. For common steel and concrete bridge types built after 1945, a new national process to identify exceptional significance was introduced in 2012 (see Section 5.C for how this was applied).

As explained in the bulletins, the National Register employs four criteria for evaluation: A, B, C, and D. *Criteria A* and *B* involve associative value, *Criterion C* involves design or construction value, and *Criterion D* involves information value. These criteria and related guidance documents provide the basis for determining whether the bridges in the subject population are eligible or not eligible for listing in the National Register. The National Register is the official list of the nation's historic places worthy of preservation.

Criterion A: Events – Properties that are associated with events that have made a significant contribution to the broad patterns of our history

Criterion A applies to structures that have an important association with single events, a pattern of events, repeated activities, or historic trends that are significant within the context of Louisiana's transportation and bridge-building history. Few bridges are typically found eligible for listing in the National Register under *Criterion A*.

Criterion B: Persons – Properties that are associated with the lives of persons significant in our past

Criterion B applies to properties that illustrate the important achievements of a person who was significant in Louisiana's past. However, it should be noted that bridge engineers, designers, and artisans are often represented by their works, which may be eligible under *Criterion C*. As a result, *Criterion B* rarely applies to bridges. No bridges in the subject population were found to meet National Register *Criterion B*; therefore, it is not included in the discussion of National Register Criteria applicability or the results section.

Criterion C: Design/Construction – Properties that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction

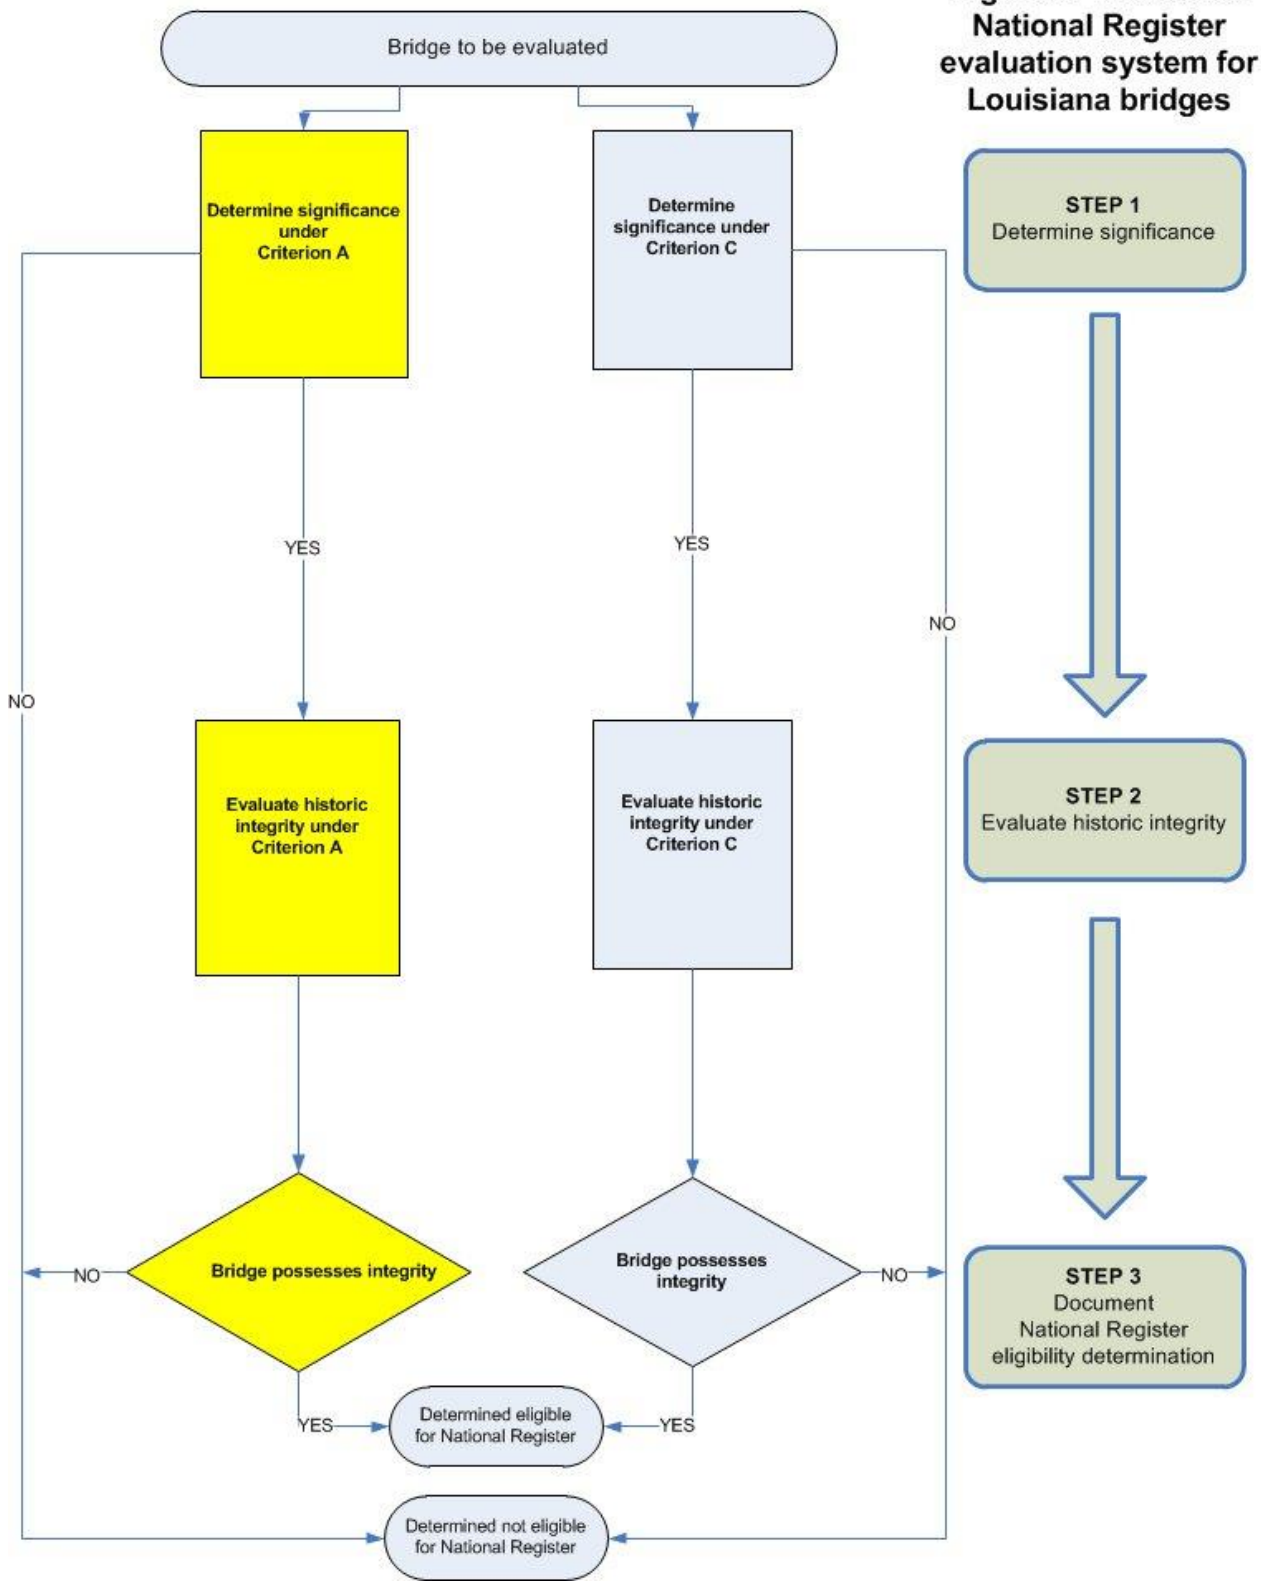
Criterion C applies to structures that have distinctive design or construction characteristics that demonstrate the following: (1) the pattern of features common to a particular class of resources, (2) the individuality or variation of features that occurs within the class, (3) the evolution of that class of resources, and/or (4) the transition between classes of resources. Bridges determined to be eligible for listing in the National Register most often meet *Criterion C.*

Criterion D: Information Potential – Properties that have yielded, or may be likely to yield, information important in prehistory or history

Criterion D most often applies to archaeological properties that are expected to yield important information through analysis of remains. Bridges were not evaluated based on National Register *Criterion D* because it is highly unlikely that this criterion would apply to an intact structure.

Figure 1 illustrates the three-step evaluation process. To be listed in the National Register, a property must not only be shown to have significance under one or more of the National Register criteria, but it also must have integrity. Integrity pertains to the ability of a property to convey its significance. The seven aspects of integrity are further addressed in in Section 6.A. Determination of National Register eligibility requires evaluation of both significance and integrity. As each bridge is evaluated, it is determined to be either eligible or not eligible based on its individual merit.

Figure 1. Illustrated National Register evaluation system for Louisiana bridges



THIS PAGE INTENTIONALLY LEFT BLANK

5. Determining Significance

This section provides detailed information about National Register *Criteria A* and *C*, which are the criteria found to apply to bridges in the subject population. In *Step 1 – Determine Significance*, as shown in Figure 1, the potential significance of each bridge is evaluated based on the bridge's contribution to the broad patterns of history and/or engineering. To be eligible, a bridge must be associated with at least one area of significance and must be able to convey its significant association. Specific considerations under *Criteria A* and *C* are presented.

A. *Criterion A*

Under *Criterion A*, bridges will be eligible if they are associated with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. To possess significance, a direct connection between the bridge and an important state or local event, trend, or pattern must be demonstrated. Bridges eligible under *Criterion A* are associated with one or more of the following areas of significance.

(1) Transportation

The area of significance of Transportation is defined in the National Register Bulletin as the process and technology of conveying passengers or materials. Significant transportation associations include major river crossings and grade-separation structures. Association with a transportation route alone is not sufficient for a bridge to be individually eligible for the National Register.

(a) Routes

A bridge associated with an important route, and constructed during the route's period of significance, will possess significance if the structure itself provided an important link in the system and can, on its own, convey the significance of the route. An individual bridge is not likely to be significant simply because of its presence within a larger transportation network of interconnected resources. For an individual structure to be eligible for its transportation association, it needs to, on its own, be an important crossing and its individual significance within the larger transportation network must be substantiated by documentary evidence. As a result, bridges associated with an important transportation route are not likely to be individually eligible for the National Register. Such bridges may be a contributing resource within a historically significant transportation route. Further evaluation of identified routes, including features, termini, and integrity, would be necessary to determine if the overall route, including component bridges, is eligible for the National Register.

(b) Major river crossings

An area of significance under the theme of transportation includes structures designed to allow for navigation that facilitated transportation within the state and region, as well as Interstate transportation. Bridges constructed to replace ferries represent an important development in the area of Transportation within the state. To possess significance, the bridge must have a direct and documented association with the transportation of goods, or be the first vehicular river crossing on a major transportation route.

(c) Grade-separation structures

Grade-separation includes solutions to eliminate dangerous intersections of highways and railroads, usually consisting of either relocation or the construction of elevated bridges that separated auto traffic from railroad traffic. Early examples will be significant for their role in improving transportation safety and later examples will be significant under both Transportation and Politics/Government as federal initiatives of the New Deal Depression-era programs (as described below).

(2) Politics/Government

This area of significance is defined in the National Register Bulletin as the enactment and administration of laws by which a nation, state, or other political jurisdiction is governed and activities related to the political process. State and federal programs intended to stabilize the economy and increase employment represent an important trend in Louisiana transportation history. Federal programs of the New Deal provided relief funding and established policies and priorities that affected bridge and infrastructure construction. In the 1930s grade-separation projects were one focus of New Deal programs. Bridges and grade-separation structures will be significant for their direct association with New Deal programs. For an individual structure to be eligible based on its association with Depression-era programs, it needs to be directly associated with a Depression-era program through funding or work-relief efforts as substantiated by documentary evidence. The theme of Politics/Government is closely tied to Transportation since the purpose of the government programs was to enhance mobility.

(3) Conservation

The area of significance of Conservation is defined in the National Register Bulletin as the preservation, maintenance, and management of natural or manmade resources, including flood control. As part of larger conservation efforts to limit flooding, bridges were integrated with spillways. Bridges integrated with spillways and those associated with crossing floodplains will be eligible if they are important part of a significant conservation effort.

B. *Criterion C*

Criterion C applies to bridges that are significant in the area of Engineering for their design and/or construction, including such considerations as engineering features and aesthetic treatment. A bridge is typically deemed to possess significance under *Criterion C* for distinctive features related to its superstructure. For example, in the design of a Pratt through truss bridge, the significance is associated with the particular configuration of truss members that form the superstructure. In Louisiana, due to challenging site conditions and the nature of the geography, in some cases a bridge's foundation or substructure shows engineering distinction.

The three considerations of *Criterion C* that apply to bridges are presented below.

(1) Distinctive characteristics of a type, period, or method of construction

Distinctive design or construction characteristics include patterns of features common to a particular bridge type, variations of features within bridge types, and evolutions/transitions that illustrate an important variation within an established bridge type. Bridges that possess significance include those that:

- Illustrate the early use of a type in Louisiana
- Represent distinctive design features or subtype
- Demonstrate innovative or complex technological solutions related to the site
- Introduce or apply new materials, designs, and technologies
- Exhibit evolution or variation within a bridge type

(2) High artistic value

This aspect of *Criterion C* considers bridges that were designed with outstanding architectural style as expressed in their overall form, aesthetic treatment, or applied ornamentation. However, most Louisiana bridges are utilitarian and the intentional application of ornamentation or other aesthetic treatments is typically limited. A bridge will have high artistic value when its combination of decorative features is able to convey overall aesthetic value.

(3) Work of a master

This aspect of *Criterion C* considers bridges that express substantial evidence of the distinguishing characteristics of a master's important work. A bridge may represent the work of an important engineer, designer, fabricator, or builder recognized either nationally or in Louisiana. A bridge recognized for its significance as the work of an engineering master needs to be distinguishable from others in its characteristic style and quality. This high standard requires both the presence of a recognized engineering master and a bridge that clearly reflects that master's characteristic work.

C. Post-1945 *Program Comment*

The Advisory Council on Historic Preservation (ACHP) issued a *Program Comment for Common Post-1945 Concrete and Steel Bridges (Program Comment)* in November 2012 addressing the eligibility of common post-1945 concrete and steel bridges and culverts. Based on provisions put in place under the P*rogram Comment*, the eligibility evaluation of specific types of bridges and culverts built after 1945 is pursued differently from that typically conducted for historic-age bridges. As a result of these provisions, post-1945 bridges of common types—including reinforced concrete slab bridges, reinforced concrete beam and girder bridges, steel beam multi-beam and multi-girder bridges, and various types of steel and concrete culverts—must meet a higher standard of exceptional significance to be evaluated as eligible for the National Register. The *Program Comment* does not cover National Register-listed or determined eligible bridges, or the following bridge types: arch, truss, movable, suspension, cable-stayed, or covered.

Bridges of the common types covered by the *Program Comment* have exceptional significance and are considered eligible when:

- They have a significant association with a person or event
- They are a very early or particularly important example of its type in Louisiana or in the nation
- They have distinctive engineering or architectural features that depart from standard designs
- They display other elements that were engineered to respond to a unique environmental context

THIS PAGE INTENTIONALLY LEFT BLANK

6. Evaluating Integrity

To be listed in the National Register, a property must not only be shown to be significant under the evaluation criteria, but also must display historic integrity. As presented in Figure 1 of this report, the evaluation system involves three steps. In *Step 2 – Evaluate Historic Integrity*, integrity is evaluated based on an assessment of the physical features related to significance and the bridge's ability to convey significance. Those bridges that do not retain sufficient integrity to convey significance are not eligible for listing in the National Register.

A. Aspects of integrity

Historic integrity is distinguished from structural (or functional) integrity, which describes the ability of a structure to perform its original design function. A bridge may possess structural integrity while lacking historic integrity, or may possess historic integrity while lacking structural integrity. For example, a bridge significant for its superstructure design that has had its substructure undermined through flooding may not function as originally designed, but will retain historic integrity if no change had been made to the superstructure.

Within the concept of integrity, the evaluation criteria cite seven aspects or qualities that, in various combinations, define integrity. To retain historic integrity, a property will always possess several, and usually most, of the aspects. The seven aspects of integrity are:

- *Design – The combination of elements that create the form, plan, space, structure, and style of a property*

  Design refers to the physical features that make up the structure. In bridges, changes in design often are closely related to changes in key features and related materials.

- *Materials – The physical elements that were used in the original design and construction of a bridge*

  Bridge materials (concrete, steel, or timber) are used in a structure's design and construction. Bridge materials are intimately connected with design.

- *Workmanship – The physical evidence of the crafts used in the construction of a bridge*

  Workmanship reflects the labor and skill of artisans. With the increasing standardization and industrialization of bridge design and construction during the twentieth century, the work of artisans became rare and was not found to be a significant aspect of integrity for bridges of the subject period.

- *Location – The place where the historic property was constructed or the place where the historic event occurred*

  Location refers to the specific place where a bridge was built and/or an event occurred.

- *Setting – The physical environment of a historic property*

  Setting refers to the character of the place in which the bridge played its historical role. Setting often reflects the basic physical conditions under which a property was built and the functions it was intended to serve.

- *Feeling – A bridge's expression of the aesthetic or historic sense of a particular period of time*

  The aspect of feeling results from the presence of physical features that, taken together, convey the property's historic character.

- *Association – The direct link between an important historic event or person and a historic property*

  A property retains association if it remains in the place where the important event or activity occurred and is sufficiently intact to convey that relationship to an observer.

An important part of establishing integrity is determining whether a bridge retains the essential physical features that are character-defining and enable it to convey its historic identity. This process involves defining the essential physical features related to significance, determining if the features are retained and visible enough to convey significance, and determining which aspects of integrity are important to the bridge's significance and if they are present.

In considering integrity, the degree of change to a bridge as evidenced by any alterations over time is weighed against the nature and degree of its engineering or historical significance. The period of significance is called out as a benchmark against which the bridge should be compared to determine whether or not it retains historic integrity. National Park Service guidance on the period of significance is outlined in the National Register Bulletin *How to Complete the National Register Registration Form*, which defines period of significance as the "length of time when a property was associated with important events, activities, or person, or attained the characteristics which qualify it for National Register listing." For a bridge to retain physical integrity, its present appearance should closely resemble its appearance during the time the bridge derived its significance. Alterations introduced after the period of significance generally negatively impact a bridge's historic integrity.

Different aspects of integrity affect the eligibility of a structure in different ways, depending on how each relates to the property's significance. The retention of specific aspects of integrity is paramount for a property to convey its significance under each of the evaluation criterion. Therefore, the assessment of integrity for *Criterion A* differs from the assessment for *Criterion C*. The degree of the alteration (major or minor) also affects the assessment of the change and its impact on historic integrity. A major alteration is significant enough to diminish the historic integrity of a bridge and therefore render it not eligible for listing in the National Register. A minor alteration will not impact the historic integrity of a structure to render it not eligible. However, cumulative minor alterations will lead to an overall loss of historic integrity and render a structure not eligible. A discussion of the aspects of integrity and their relationship to *Criteria A*

and *C* follows. Examples of the types of major alterations that render a structure not eligible for listing in the National Register and examples of minor alterations that do not impact eligibility are included.

B. Integrity considerations related to *Criterion A*

Criterion A relates to the significance of a structure gained through its historical associations. Therefore, integrity aspects of location, setting, feeling, and association play an important role in conveying the structure's significance. As a result, these aspects of integrity are often weighed more heavily in the assessment of a structure's overall historic integrity under *Criterion A*. Integrity aspects of design, workmanship, and materials are also important, but alterations that affect these aspects do not result in the same level of diminished integrity. Table 3 summarizes examples of alterations and provides guidance on their relative importance to the loss of historic integrity for a structure to be eligible under *Criterion A*.

Table 3. Assessment of historic integrity under *Criterion A*

Category	Item	Examples
Location, setting, feeling, and association	***Extensive alteration (major)*** These major alterations lead to an overall loss of historic integrity that renders a structure not eligible under *Criterion A.*	• Relocated, where relocation clearly separates structure from context of historic theme (e.g., bridge is significant for relationship with historic event and is relocated away from the location of the event). • Relocation where bridge no longer maintains original function (e.g., carrying traffic over water or road). • Widened superstructure with additional lanes not representing the period of significance of a transportation route and historic theme. • Extensive overall loss of historic integrity due to cumulative minor alterations.
	Alterations (minor) These minor alterations, taken alone, will not render a structure not eligible. However, the cumulative effect of several minor alterations will lead to an overall loss of historic integrity that renders a structure not eligible under *Criterion A.*	• Relocated superstructure, where relocation site possesses some elements of historic theme (e.g., bridge is significant as gateway and is relocated to another gateway site). • Rural bridge has been encroached upon with development or other features that diminish its ability to convey its association with the historic theme. • Lengthened superstructure.

Table 3. Assessment of historic integrity under *Criterion A*

Category	Item	Examples
Materials, workmanship, and design	***Alterations (minor)*** These minor alterations taken alone will not render a structure not eligible. The cumulative effect of several minor alterations will lead to overall loss of historic integrity that renders a structure not eligible under *Criterion A.*	• Replacement of features/materials not in-kind. • Change in railing/parapet or guardrail, including replacement or loss.[13] • Replacement of main members in-kind. • Addition of protective sheet metal on the underside of the superstructure.

C. Integrity considerations related to *Criterion C*

Since *Criterion C* relates to the engineering and/or architectural significance of a structure, the integrity aspects of design, workmanship, and materials are the most important aspects of historic integrity when evaluating a bridge under *Criterion C*. This is because they allow a structure to convey its physical features and characterize the type, period, or method of construction. A change of location or setting will result in diminished integrity under *Criterion C* when the design of the bridge appears to have been influenced by the immediate environment or site conditions. Table 4 summarizes examples of alterations and their relative importance to the loss of historic integrity for a structure to be eligible under *Criterion C*.

Table 4. Assessment of historic integrity under *Criterion C*

Category	Item	Examples
Materials, workmanship, and design	***Extensive alterations (major)*** These major alterations lead to an overall loss of historic integrity that renders a structure not eligible under *Criterion C*.	• Replacement of main members integral to superstructure. • Significant widening or lengthening of the superstructure. • Addition of new superstructure. • Removal and significant change in mechanical components (movable bridge). • Relocation or removal of operator's house or tower structure and removal of mechanical equipment. • Alteration to removable span making it permanent. • Multiple, substantial individual minor alterations creating cumulative effect on integrity.

[13] Railing alterations are frequently seen because new railings are often built to meet current safety standards. Alterations to railings do not necessarily result in a loss of historic integrity, particularly where a bridge's superstructure is considered to be the physical feature that possesses significance.

Table 4. Assessment of historic integrity under *Criterion C*

Category	Item	Examples
Materials, workmanship, and design	***Alterations (minor)*** These minor alterations taken alone will not render a structure not eligible. The cumulative effect of several minor alterations will lead to an overall loss of historic integrity that renders a structure not eligible under *Criterion C.*	• Added main or supporting members to substructure or superstructure and bridge retains original function. • Removal or alteration of main structural members. • Replacement of features/materials not in-kind. • Change in railing/parapet or guardrail, including replacement or loss.[14] • Alterations or changes to the operator's house such as change in roofline or new windows (movable bridges). • Addition of new operator's house where original remains (movable bridges). • Replacement of mechanical components (movable bridges). • Replaced approach span or substructure. • Movable bridge fixed in open position (mechanical equipment remains). • Alteration to locking mechanism (movable bridge). • Minor widening or lengthening of the superstructure.
Location, setting, feeling, and association	***Extensive alterations (major)*** These major alterations lead to an overall loss of historic integrity that renders a structure not eligible under *Criterion C*. ***Alterations (minor)*** These minor alterations will not render a structure not eligible under *Criterion C*.	• Relocation where bridge no longer maintains original function (e.g., carrying traffic over water or road). • Relocated superstructure when relocation does not affect engineering significance. • Significant change in setting.

[14] Railing alterations are frequently seen because new railings are often built to meet current safety standards. Alterations to railings do not individually result in a loss of historic integrity, particularly where a bridge's superstructure is considered to be the physical feature that possesses significance.

THIS PAGE INTENTIONALLY LEFT BLANK

7. Results

A. Introduction

In the final evaluation step (*Step 3 – Document National Register Eligibility Determination)* a determination of National Register eligibility is made, and the eligibility determination is documented. The determination is the outcome of one of three potential equations:

1. A bridge that possesses significance under one or more of the National Register criteria and retains historic integrity is considered eligible.

2. A bridge that possesses significance under one or more of the National Register criteria but does not retain sufficient historic integrity to convey that significance is considered not eligible.

3. A bridge that lacks significance under National Register criteria, regardless of historic integrity, is considered not eligible.

National Register eligibility results by area of significance applying National Register *Criterion A*, and by bridge type applying National Register *Criterion C*, are presented in this section. Results are summarized in Table 5. Due to their special considerations under the ACHP's *Program Comment*, post-1945 common bridge types are presented separately (see Section 7.D).

Table 5. Eligibility results by bridge type

Bridge Type	Population	Previously listed or determined eligible	Eligible			Total Eligible (includes previously listed or determined eligible)	Not Eligible
			Criterion A (Only)	*Criterion C* (Only)	*Criteria A and C*		
Concrete arch	9	0	0	1	8	9	0
Concrete beam and girder (pre-1946)	92	3	4	3	1	11	81
Concrete rigid frame	5	0	0	4	1	5	0
Culvert (pre-1946)	245	0	0	2	0	2	243
Movable	87	14	1	52	3	70	17
Steel beam and girder (pre-1946)	33	3	6	2	3	14	19

Table 5. Eligibility results by bridge type

Bridge Type	Population	Previously listed or determined eligible	Eligible			Total Eligible (includes previously listed or determined eligible)	Not Eligible
			Criterion A (Only)	*Criterion C* (Only)	*Criteria A and C*		
Timber	1,089	0	0	0	0	0	1,089
Truss	31	15	0	11	2	28	3
Common types (post-1945)	2,988	1	0	6	4	11	2,977
Total	**4,579**	**36**	**11**	**81**	**22**	**150**	**4,429**

Eligibility results for individual bridges are presented in the Appendices organized first by parish and then by recall number. Appendix C presents basic descriptive information and the National Register status for each bridge evaluated in this study. Appendix D.1 presents bridges that are eligible for, previously determined eligible for, or listed in the National Register, including statements of significance and other pertinent descriptive information. Appendix D.2 includes inventory forms for eligible bridges with more detailed descriptive information and photographs. Appendix E presents bridges that are not eligible for National Register listing, including statements of significance and basic descriptive information. A "statement of significance" explains how a bridge qualifies for National Register listing and links the property to one or more of the National Register criteria.

B. *Criterion A*

To support the eligibility determinations for bridges found to be eligible under *Criterion A*, this section provides a summary of the applicable historical themes.

(1) Transportation

Nineteen bridges relate to the National Register area of significance of Transportation, reflecting several important trends in the state's transportation history. Grade-separation structures reflect important early state efforts and subsequent federal work-relief efforts to provide safe railroad-highway crossings. Other examples related to Transportation are the first vehicular crossings that replaced earlier ferry operations and structures that provide important crossings of a floodplain (Morganza Floodplain and Atchafalaya Floodway) or the Industrial Canal in New Orleans.

(2) Politics/government

Twenty-one bridges relate to the area of significance of Politics/Government. These structures are examples of the Depression-era work-relief programs, including those sponsored by the WPA and receiving NIRA funding. Structures eligible for their historical association with Politics/Government represent improvements to infrastructure that include grade-separation structures to provide safe railroad and highway crossings and bridges in New Orleans's City Park built as part of the overall redevelopment of the park by work-relief forces.

(3) Conservation

Three bridges relate to the area of significance of Conservation. These structures are integrated with major spillways that were constructed as part of larger conservation efforts to manage flooding. Other structures related to the area of significance of Conservation were constructed to cross over an important navigational canal, which was also created as part of a larger conservation effort.

C. *Criterion C*

To support the eligibility determinations for bridges eligible under *Criterion C*, this section provides a narrative summary of the essential characteristics of the subject population by bridge type. For each type, the following information is provided:

- Early use in state, where such examples remain
- Design features that characterize the bridge type
- Summary of historical patterns of use of the bridge type in Louisiana
- Recognized bridge subtypes
- Variations within the bridge type, as manifest in special features of design or construction
- Innovations or engineering complexity present in the bridge type
- Aesthetic features found, if any
- Alterations that affect historic integrity

A table summarizes the category and subcategories under *Criterion C* that were found to be applicable for each bridge type in the subject population. The summaries presented below support the statement of significance included on the inventory form for each bridge (see Appendix D).

In evaluating the subject population, no substantial evidence was found that any bridge possesses the distinguishing characteristics of a master's important work. Although certain bridges were linked to an important engineer, designer, or builder recognized either nationally or in Louisiana, such bridges were not distinguishable from others in its characteristic style and quality. Therefore, no bridges met the high standard that requires both the presence of a recognized engineering master and a bridge that clearly reflects that master's characteristic work.

(1) Concrete arch

The reinforced concrete arch is characterized by the following design features:

- Concrete arch supporting a deck
- Closed-spandrel wall
- Arch ring and barrel
- Railing and endposts, often integrated into the spandrel wall

Reinforced concrete arch bridges are considered to be significant as examples of a distinctive bridge type. The concrete arch came into widespread use nationally in the late 1890s and continued in popularity through the 1940s, especially in locations where an aesthetically appealing bridge was desired.

Many later examples of concrete arches are related to Depression-era federal work relief programs that sponsored construction of concrete arch spans in park settings. Despite its popularity, the concrete arch was less common nationally compared to other reinforced-concrete bridge types, including the concrete slab and girder bridges. This is especially true in Louisiana, with only nine examples dating from 1924 to 1939. All bridges have a closed-spandrel configuration and are located in New Orleans's City Park. Eight of the nine extant reinforced concrete arches, dating from 1936-1939, are directly related to Depression-era relief programs. The rarity of the arch bridge type in Louisiana may be related to challenges of placing stable foundations, which were needed to support the weight of the arch.

In addition to being an uncommon bridge type in the state, reinforced concrete arch bridges exhibit high artistic value with Classical Revival or Art Deco aesthetic treatments. One example exhibits the Classical Revival design aesthetic and includes curved railings with arched posts; recessed or arched panels in the railing or end posts; carved flowers, urns, and/or inscribed cartouches; and integrated lamp posts. The remaining eight bridges express Art Deco influences, including geometric patterns, inscribed vertical lines, crowned and beveled parapets, and recessed arch rings. A more modest example constructed late in the period reflects the transition from Art Deco to a more restrained Streamline Moderne style as reflected by its use of limited ornamentation to emphasize overall horizontal massing. Several concrete arches constructed during the Depression by the WPA also display bas-relief sculptures on the parapet walls or exterior pier columns. Designed by sculptor Enrique Alferez, the bas-relief carvings feature reclined figures, WPA workers, and tools, which further enhance the design aesthetic of the bridge.

Eight of the nine reinforced concrete arches were designed under the direction of architect Richard Koch and contractor/engineer George Rice during the redesign of City Park by WPA efforts between 1936 and 1939. Alferez completed a number of sculptures throughout the park, including the bas-relief carvings for five of the bridges. Research found no evidence that the eight reinforced concrete arch bridges in City Park represent the defining work of Koch, Rice, or Alferez. Despite this association, no evidence was found to substantiate that the bridges represent the finest work of a master architect or artist.

This bridge type exhibits few if any alterations affecting historic integrity. Minor changes include replacement of a light fixtures with a compatible fixture.

Concrete arch – application of *Criterion C* areas of significance

***Criterion C* category**	**Subcategory**	**Feature**
Distinctive characteristics of a type, period, or method of construction	Early use of type in state	N/A
	Distinctive design features or subtype	Reinforced concrete arch
	Innovative or complex technological solution related to site, including foundation and substructure design for this type	N/A
	Application of new material or technology for this type	N/A
	Evolution or variation within this bridge type	N/A

Concrete arch – application of *Criterion C* areas of significance

***Criterion C* category**	**Subcategory**	**Feature**
High artistic value	Selected ornamentation, notable but isolated	N/A
	Outstanding ornamentation or overall architectural treatment	• Classical Revival features • Art Deco features • Transition to Streamline Moderne features • Bas-relief sculptural features
Work of a master		N/A

(2) Concrete beam/girder and rigid frame

The category of concrete beam/girder bridges includes two subtypes: concrete slab and concrete deck girder. A third type of reinforced concrete bridge is the rigid frame which features a cast-in-place unit of substructure and superstructure components. A variation within the concrete slab and rigid frame bridge types is monolithic construction.

The state's earliest concrete bridges were typically designed as monolithic reinforced concrete structures with bridge elements integrated together. Examples include concrete slabs and rigid frames. In having concrete elements cast together or embedded into another bridge element, the entire structure worked together as one monolithic unit. The superstructure was typically integrated into the adjacent bents (and piers where applicable) and with the bridge deck. The practice of combining concrete bridge elements together into a monolithic structure was later discontinued by the LHC as engineers learned more about the benefits of separating components to make repairs and maintenance easier. Monolithic concrete bridges are rare in Louisiana and considered significant if they retain integrity.

(a) Concrete slab

These bridges consist of a cast-in-place reinforced concrete slab that serves as both the deck and a structural member carrying stresses to abutments and/or piers. They are one of the simplest and most common bridge types, and are especially popular for span lengths of 30 feet or less because they are economical and simple to erect. Although the earliest concrete slabs in the U.S. date to the first decade of the twentieth century, Louisiana's extant examples post-date 1910. Beginning in the 1930s and continuing into the mid-twentieth century, a number of standard plans were developed by the state for reinforced concrete slab spans.

Variations of concrete slab design include pier caps integrated into the concrete slab to form a monolithic design, and another that consists of connecting several precast concrete slab units longitudinally to form a span. In general, concrete slabs were built in substantial numbers during the twentieth century and lack individual engineering distinction with the exception of these variants.

(b) Concrete deck girder

Concrete deck girders, also called tee beams, feature rectangular concrete beams supporting an integral deck slab or a cast-in-place concrete deck used for the roadway surface. Concrete deck girders were introduced in the 1910s and were common nationally and in Louisiana from the 1920s to the 1940s. The

state produced standard plans for concrete deck girders as early as 1922. Concrete deck girder bridges constructed prior to this time are considered important early examples of the subtype.

The integration of the beam and deck increases bridge strength and allows greater span lengths. A simple span design was most common, with typical span lengths of 30 to 50 feet. A variation is the continuous span, wherein the beam spans uninterrupted over one or more intermediate supports. The distinguishing feature of all concrete deck girder bridges is the reinforced concrete slab integrated with longitudinal beams. Only one continuous concrete deck girder was identified in the subject population.

Typically, significant length indicates complex technological solutions related to site conditions. One non-continuous concrete deck girder bridge possesses significant overall structure length. Its overall length of nearly 19,000 feet far exceeds that of all other concrete deck girder bridges and is a reflection of the complexity of engineering required to manage challenging site conditions.

Concrete deck girders typically exhibit little aesthetic treatment. Decorative parapets, end posts, brackets, pier forms, or light standards can be present. Individually, these features do not amount to high artistic value; however, a combination of these features may create notable overall design aesthetic.

(c) Concrete rigid frame

In rigid frame construction the superstructure and substructure components are integrated into a single, monolithic cast-in-place unit. This type of construction was considered to be an efficient use of material, easy to build, and aesthetically pleasing. First used in the U.S. in the 1920s, rigid frame bridges are considered to be the last major type of reinforced concrete bridge to be developed. Compared to their widespread use nationally, this bridge type is rare in Louisiana with only three known examples.

The distinguishing feature of concrete rigid frame bridges is the homogenous cast-in-place unit of substructure and superstructure components. This bridge type was readily adaptable for architectural and ornamental treatment, so decorative elements were often incorporated into the design, especially if the bridge is located within an urban setting or on a parkway. One example in City Park in New Orleans displays Art Deco influences, including haunched span, vertical ribbing and flutes on the posts, curved end walls, and bold font used for the WPA stamp.

No alterations affecting historic integrity of concrete rigid frame bridges were identified.

	Outstanding ornamentation or overall architectural treatment	Overall design aesthetic of the Art Deco style
Work of a master		N/A

(4) Culverts

A culvert is a structure placed under a roadway to allow a stream or other drainageway to pass. The structural unit or hydraulic opening through which water flows is sometimes called a cell or barrel.

Culverts are characterized by the following design features:

- Concrete box-shaped structure or multi-plate arch opening
- Simple structure without railing or sidewalk
- Individual cells or barrels that may be combined to create larger structures

While culverts were historically constructed of a variety of materials, including timber and stone, extant pre-1971 culverts in Louisiana are constructed of either metal or concrete. Concrete culverts come in a variety of shapes, but most often are found in the box or pipe configuration. Standard plans for concrete box culverts were developed in Louisiana as early as 1914. The vast majority of Louisiana's pre-1971 culverts are examples of the concrete box type. Another example of a box culvert is a double cell, where two rows of culvert barrels are placed on top of each other to solve more complex engineering issues. A distinctive culvert type is the multi-plate arch, which is formed of curved, corrugated metal segments. These segments are braced on concrete headwalls and piers, and the curved segments are bolted together to form an arch.

Culverts are common both nationally and in Louisiana. They were typically constructed using prefabricated materials and have common forms that lack engineering complexity or significance. As a result, culverts are generally not eligible for the National Register as individual structures. Culverts that are eligible for the National Register are distinguished by unique and significant design features, including decorative stonework or unusual aesthetics, or complex engineering.

Work of a master		N/A

(5) Movable

The basic principle of a movable bridge is ancient: a span, or spans, is moved to provide navigation clearance. Depending on the span type, the movement may be in a horizontal plane or a vertical plane to take the span out of the way of a vessel on the water. Modern movable bridges resulted from the development of engines and motors to mechanically manipulate the span and control systems to govern the action. Some of these innovations were originally developed in the design and construction of railroad bridges in the nineteenth century. Innovation continued with the use of movable bridges for roads and highways, particularly in the development of modern control systems. Louisiana has one of the largest collections of movable bridges of any state due to its extensive network of commercial waterways. Movable bridges provide an important solution for accommodating vehicular and marine traffic along the state’s extensive network of bayous, rivers, channels, and canals. In addition to having a large number of movable bridges, the state also boasts a wide variety of types and sizes of movable bridges. Movable bridges are divided into four major types, as detailed below. Many variations related to operation of mechanical systems also exist. Several distinctive subtypes and variations are found in Louisiana, with certain examples such as the pontoon swing and cable-stayed swing being quite rare.

Standard plans for movable bridge subtypes were developed by the LHC (later the LDH) between 1924 and 1963. Standard plans were periodically revised during this period with small changes made to existing plans. As-built plans indicate that standard plans were sometimes used as a general guide for designing and constructing a bridge, with slight modifications to existing plans to meet site-specific

conditions. Standard plans were also available for operator's houses; one design included pilasters and another featured horizontal scribed lines and pelican emblems embossed into the concrete walls. Extant examples of movable bridges in Louisiana date from 1914 to 1970.

(a) Bascule

In a bascule bridge, the movable span or "leaf" rotates vertically around a horizontal axis to raise the leaf and clear the navigable channel for marine traffic. Bascule bridge subtypes in Louisiana include single- and double-leaf trunnions, and heel trunnions (another bascule subtype that exists nationally is the rolling lift bascule bridge, but there are no rolling lift examples in the subject population). Design features of bascule bridges include:

- Movable span (leaf) constructed as plate girder, beam, or (occasionally) truss.
- Trunnion as a pivot point with rack-and-pinion system to raise the leaf.
- Counterweight opposite the leaf, typically enclosed in abutment pit.
- Locking mechanisms and load shoes to secure the leaf.
- Operator's house.

Subtypes found in Louisiana generally consist of the following configurations and design features:

- Single-leaf I-beam bascule – Single span (leaf) that pivots on a fixed shaft with counterweight, powered by manually operated winch.
- Double-leaf trunnion bascule – Two opposing spans (leaves) that rotate on trunnions with counterweights attached to the rear of each span; counterweights descend into chambers or pits when in open position. Unlike single-leaf bascules, double-leaf bascules act as cantilevers; when in closed position, with the two opposing spans held in place by load shoes that prevent the span from further downward rotation and center locks that keep the two spans properly aligned.
- Strauss heel trunnion – In this distinctive and innovative bascule subtype, the main span and counterweight are mounted on separate but interconnected assemblies and pivot around two separate trunnions. Joseph Strauss was successful at patenting and marketing numerous movable bridge designs during the early twentieth century, including heel trunnion examples.[15] The overhead configuration of the heel trunnion, as used on the Louisiana example, eliminates the need for a pit below grade because the counterweight is mounted overhead. This design allows the trunnion to be placed closer to the waterway, enabling an overall shorter leaf. By eliminating the counterweight chamber, heel trunnions offered a more flexible design solution in

[15] Strauss established the Strauss Bascule Bridge Company in 1902 and was a forerunner in developing cost-saving and engineering solutions for movable bridges, including the use of concrete counterweights rather than metal. He is also known as the chief engineer for the construction of the Golden Gate Bridge.

terms of structure size and length. Heel trunnion bascules became popular for railroad bridges and are considered less common for vehicular bridges.

Louisiana has seven bascule bridges (four listed or previously determined eligible) constructed between 1919 and 1964. Known standard plans for steel single-leaf trunnion bascules date to 1929. This type is found throughout the U.S. and the earliest examples are generally considered to be those constructed prior to 1930. Within Louisiana, the bascule type is considered uncommon, especially in comparison to the populations of other movable bridge types. A limited number of bascule bridges were constructed after 1970.

Alterations affecting historic integrity of the bascule bridge type include:

- Removal and significant change in mechanical components, considered major
- Removal and significant change in mechanical components (movable bridge), considered major
- Alterations to operator's house, considered minor

Bascule – application of *Criterion C* areas of significance

Work of a master		N/A

(b) Pontoon swing

The pontoon swing bridge is a distinctive type of movable bridge in which the movable "span" is a floating barge, termed a "pontoon," which is floated to the channel bank to open the navigable channel to marine traffic. Pontoon swing bridges consist of the following design features:

- Floating pontoon, constructed of wood or metal, that swings open for marine traffic.

- Pivot arm that connects pontoon to pivot point on shoreline and allows the swinging movement.

- Hand- or motor-operated system of cables, pulleys, sheaves and winches that enables and controls the movement of the pontoon.

- Operator's house, typically houses winch and other mechanical systems and can be located on-board the pontoon or on-shore.

- Approach aprons that enable vehicular access to the bridge by bringing the approach roadway into alignment with the pontoon driving surface. These aprons are typically operated via a motorized hoist system housed in towers at the edge of the approach spans; approach aprons can also be attached to the pontoon and operated using hydraulic cylinders.

Louisiana has seven metal pontoon swing bridges constructed between 1953 and 1967. Known standard plans for metal pontoon swing bridges date to 1963. The pontoon swing bridge is very uncommon nationally, with most examples restricted to Louisiana and Texas. One bridge in the subject population represents a variation within the type as a floating pontoon with a secondary steel I-beam deck. Operator's houses can be of frame or metal construction and located on the floating pontoon or on the shoreline. A limited number of pontoon swing bridges were constructed into the 2000s.

Alterations affecting historic integrity of this bridge type include:

- Relocation or removal of operator's house and associated mechanical components, may include removal of original house, considered major

- Changes in railing, considered minor

- Replacement of mechanical components, considered minor

- Alterations or removal of approach apron hoist mechanism, considered minor

- Alterations to operator's house, considered minor

(c) Swing

The swing bridge is a type of movable bridge in which the span rotates horizontally about a center pivot to clear the navigable channel for marine traffic. The movable span typically is a beam, girder, or truss. Louisiana also has examples in which the span arms are cable-stayed swing spans. Distinctive design features of swing bridges include:

- Movable span that rotates horizontally on pivot pier and includes two span arms supported from a center unit or tower; span arms may be symmetrical or asymmetrical.

- Pivot pier that carries the turning mechanism and the swing span.

- Turning mechanism – swing bridges feature either a rim-bearing or center-bearing turning mechanism. Center-bearing turning mechanisms feature a large spherical thrust bearing, located at the center of the pivot pier, which carries the load of the swing span. Balance wheels aligned on a circular track on the outside of the pivot pier prevent the span from tipping out of plane during operation. The evaluated bridges are center-bearing examples.[16]

- Operator's house (unless bridge was designed for manual operation only).

- Locking devices incorporating a wedge mechanism:
  - Mechanically operated (earlier examples).
  - Hydraulically operated (later examples).

- Counterweight (if bridge is asymmetrical) – counterweights vary but typically consist of concrete added to the shorter arm of the swing span.

Louisiana has 42 swing bridges (including seven previously listed or determined eligible) constructed between 1916 and 1969. Known standard plans for swing types were available by 1924 and continued until 1961. Swing bridges were one of the earliest types of movable bridges used nationally and featured

[16] The other type of turning mechanism found on swing bridges is rim-bearing. Rim-bearing turning mechanisms have tapered rollers situated on a circular track on top of the pivot pier. Each roller is mounted on a radial shaft, which restrains the bridge from moving away from the pivot pier. A second track attached to the bottom of the swing span rests on top of the rollers. The weight of the span is carried by the rollers. Only two rim-bearing examples are known to exist in Louisiana and both were previously listed or determined eligible for listing in the National Register.

a pivot pier in the navigable channel, which posed an obstacle to water-going vessels. For this reason, the popularity of swing bridges began to diminish by the 1930s as bascule and vertical lift types became the preferred choice since they do not require a pier in the navigation channel. Swing bridges continued to be built in Louisiana into the 2000s. The population of swing bridges is decreasing nationally due to replacement projects to remove the obstruction posed by mid-channel pivot piers.

Several subtypes exist within the subject population, including the following:

- Cable-stayed swing span – steel beam or truss swing span with tower structure above the pivot pier. Cables tie floor beams to the central tower structure and support the bridge arms when in open position. The bridge is turned using manually operated ropes, with assistance from a motorized winch. Unlike other swing bridges, these examples do not have sophisticated locking mechanisms. Several have been altered with additional truss members to account for increased loads. Operator's houses are located along the shoreline and are typically simple vernacular structures of either metal or frame construction; several examples do not have an operator's house. This subtype was typically utilized for small crossings and is highly uncommon nationally with no other known examples identified outside Louisiana. Examples constructed between 1945 and 1960 are concentrated along small bayous in Terrebonne Parish in the southern part of the state near the Gulf of Mexico.

- Through truss swing span – through truss swing span with turning mechanism situated on a pivot pier and an operator's house centered above the roadway, over the pivot pier.

- Pony truss swing span – pony truss swing spans above pivot pier in two configurations:
    - Separate, symmetrical, variable-depth Warren pony truss units comprising each span arm, joined by pinned horizontal central bars in lieu of a center tower. This configuration is considered a variation within the subtype and is used in the earliest example.

    - Single variable-depth truss unit for entire swing span, with a deeper truss unit above the pivot pier in lieu of a center tower. This subtype is represented in later examples.

- Plate girder swing span – steel plate girder swing span with pivot pier and off-board operator's house. Examples dating to before the mid-1950s are generally riveted; post-1950s examples are typically welded. Other common differences within the subtype include consistent and variable-depth girders and symmetrical and asymmetrical girder alignments; asymmetrical girders are known as bobtail swing spans. Manually operated examples are considered a significant variation within the subtype.

In addition, several bridges display light standards and decorative railings that are reflected in standard plans. These features were not considered an outstanding ornamentation and do not represent overall aesthetic treatment in combination with other features. Operator's houses can be of frame, metal, or concrete construction. Concrete examples typically reflect one of two standard designs, including one with multi-light windows, central door, and pilasters, and another with horizontally divided windows and horizontal scribed lines and a pelican emblem embedded in the concrete.

Alterations affecting historic integrity of this bridge type include:

- Added, replaced, or altered truss or girder members, considered minor (multiple considered major).
- Addition of new main superstructure, considered major.
- Altered original locking mechanism, considered minor.
- Fixed in open position, considered minor.
- Fixed in open position with missing mechanical components, considered major.
- Alterations to operator's house, considered minor.
- Added walkway, considered minor.
- Railing or guardrail alterations/additions, considered minor.
- Addition of new operator's house, considered minor (unless original removed).
- Multiple minor alterations can collectively be considered a major alteration.

	Evolution or variation within this bridge type	Pony truss swing span with separate variable truss units on each span arm Manually-operated
High artistic value	Selected ornamentation, notable but isolated	N/A
	Outstanding ornamentation or overall architectural treatment	N/A
Work of a master		N/A

(d) Vertical lift

The vertical lift bridge is a type of movable bridge in which a counterweighted simple span is raised and lowered to open a navigable channel for marine traffic. Distinctive design features of vertical lift bridges include:

- Vertically raised and lowered simple span (steel girder, steel plate girder, or truss).
- Supporting tower structures.
- Counterweights, sometimes in conjunction with balance chains, carried by ropes over sheaves on towers.
- Powered counterweight ropes/cables (tower-drive and tower drive with connected tower configurations).
- Powered uphaul and downhaul ropes/cables (span-drive configuration).
- Operator's house, in most examples.
- Locking and leveling devices and load shoes to seat the span in correct position.
- Motor(s) and drive machinery for moving the span up and down.

Vertical lift bridges are categorized based on the location of the motor(s) and the drive mechanisms. The three basic variations include the span drive, tower drive with independent towers, and tower drive with connected towers, as described below.

- Span drive – A vertical lift movable bridge where the drive mechanism is located in, under or on the movable span. The movable span is counterweighted; however, the counterweight sheaves are free spinning and do not contribute to the operation of the span. The span drive machinery raises and lowers the movable span by drawing in and paying out operating ropes that are attached to the towers. Of the two Louisiana examples of the span drive subtype, one is listed in the National Register and one has been significantly altered by removal of the towers.
- Tower drive with independent towers – A vertical lift movable bridge where two separate sets of drive machinery are located on top of two independent lift towers. The span drive machinery raises and lowers the span by rotating the counterweight sheaves by means of interconnected shaft and gears. An electrical tie between the two towers ensures that the two ends of the movable span lift evenly. The tower drive system with independent towers is typically used on the larger vertical-lift bridges. Although standard plans for this variation existed as early as 1953, only four known examples are in Louisiana.

- Tower drive with connected towers – A vertical lift movable bridge where the drive machinery is located on a structural member that spans across the waterway between the two lift towers. The span drive machinery raises and lowers the span by driving all four counterweight sheaves simultaneously by means of interconnected shafts, secondary gearboxes and gears. Although the structure connecting the two towers results in higher costs, this type of mechanism improves the level of synchronization among the four corners of the movable span in comparison to tower drive examples. It also eliminates the need for the operating ropes and associated maintenance costs found in the span drive configuration. The tower drive with connected towers is typically used on vertical lift bridges over small navigation channels with spans under 200 feet. Tower drive vertical lift bridges with connected towers are spread throughout the southernmost parishes in Louisiana with Terrebonne and Lafourche Parishes having the largest numbers. In addition, linear concentrations exist along Bayou Lafourche, Bayou Teche, and the Vermilion River. The geography and occurrence of relatively small navigable waterways in this region of the state may explain why this variation is relatively widely used in Louisiana, but quite uncommon nationally, with known examples restricted to Louisiana and New Jersey.

Louisiana has 31 vertical lift bridges (including three previously listed or determined eligible) constructed between 1914 and 1970. Known standard plans for vertical lift bridges date to 1925 and were available until at least 1959. Standard plans for tower drive vertical lift bridges with independent towers were available by at least 1953 and for tower drive bridges with connected towers by at least 1955. Only four evaluated examples include the tower drive mechanism with independent towers; the remaining examples display the tower drive with connected towers configuration. Vertical lift bridges continued to be built in Louisiana after 1970.

Operator's houses can be of frame, metal, or concrete construction. Concrete examples typically reflect one of two standard designs, including one with multi-light windows, a central door, and pilasters, and the other has horizontally divided windows, horizontal scribed lines, and a pelican emblem embedded in the concrete.

Alterations affecting historic integrity of this bridge type include:

- Removal of tower structure, including mechanical components, leaving a fixed span, considered major.
- Routine replacement of mechanical components, considered minor.
- Alterations to operator's house, considered minor.
- Railing alterations, considered minor.

(6) Steel beam and girder

Steel and beam girders in Louisiana are characterized by multiple (three or more) parallel longitudinal beams or girders extending between abutments, sometimes with intermediate piers. There are two subtypes to the steel beam and girder category: steel I-beams, including a variation with removable span, and the steel plate girder. Steel beams and girders often lack engineering distinction and were built in substantial numbers, typically following standard plans, both nationally and in Louisiana.

(a) Steel I-beam

I-beam design features include rolled I-beams connected by floorbeams. The I-beam derives its name from the "I" cross-section shape created when a web is joined to short steel flanges. Steel I-beam bridges can be simple, where the girder extends from one vertical support to another, or continuous, where the beam spans uninterrupted over one or more intermediate supports, when built over an intermediate pier. The state began developing plans for steel I-beams in the early 1920s, and continued to create and refine standard plans for the bridge type through the 1950s.

Steel beam and girder bridges typically exhibit little aesthetic treatment. Aesthetic treatments may include an open balustrade-type parapet, steel picketed railing, decorative or flared end posts, decorative pier cap design, curved or tapered brackets, or light standards. Individually these treatments do not result in a high artistic value; however, combinations of these features may create an overall design aesthetic. Four steel I-beam bridges in the subject population possess a combination of aesthetic features, specifically decorative railing, pier cap design, brackets, and end posts, that when taken together result in a bridge that exhibits high artistic value.

One I-beam bridge in the subject population derives significance by representing the continuous variation within the type. This bridge has an exceptional continuous main span length, consisting of three beams together forming a 181-foot-long continuous span. The presence of a significant main span length achieved by continuous design indicates complex technological solutions related to site conditions. This solution was employed to address crossing a railroad corridor.

A distinctive variation of the steel I-beam subtype is the I-beam with removable span. Removable span bridges are typically between 30 and 50 feet long, with an approximately 20-foot removable span. The center span is designed to be removed temporarily to allow watercraft though, though it appears the removal of the span is rare. Most have floor beam extensions on the removable span with openings for a crane to latch on and lift the span. The removable span has a grated deck surface to reduce weight for removal. The removable variation otherwise has typical I-beam design features, including I-beams connected by floorbeams. Removable span bridges have long been used in Louisiana and continue to be utilized due to the vast network of navigable waterways. Standard plans were developed by the state for removable span bridges from 1924 to 1961. The earliest extant examples in the state are from the 1930s. Removable span bridges represent less than 1% of bridges in the subject population.

Alterations affecting historic integrity of this bridge type include:

- Alterations to removable span, including paving the open grate deck, considered major
- Addition of supporting members to the substructure or superstructure, considered minor
- Widening or lengthening superstructure, considered major
- Replacement of main members integral to the superstructure, considered major
- Change to or addition of railing/guardrail/parapet, considered minor

(b) Steel plate girder

Steel plate girder design consists of built-up riveted or welded plates with a deep web fabricated to form an “I” in cross section. Steel plate girders can be simple, where the girder extends from one vertical support to another, or continuous, where the beam spans uninterrupted over one or more intermediate supports. Nationally, use of the steel plate girders began in the late nineteenth century and is a common bridge type. By 1931 the state prepared standard plans for plate girders, though relatively few plate girders were constructed in Louisiana for highway use. Only one steel plate girder was constructed prior to 1946 and has already been determined eligible. The remaining steel plate girders fall into the post-1945 period.

Steel beam and girder – application of *Criterion C* areas of significance

High artistic value	Selected ornamentation, notable but isolated	N/A
	Outstanding ornamentation or overall architectural treatment	Combination of decorative railing, piers, and endposts
Work of a master		N/A

(7) Timber

Timber bridges are examples of a simple type, built commonly in Louisiana throughout the twentieth century. They consist of the following design features:

- Treated timber stringers or beams as primary superstructure elements supported by an open, braced timber trestle framework.

- Usually short spans between 10 and 30 feet in length.

There are two subtypes of timber bridges: timber trestle and mud sill. Timber trestle bridges are constructed of treated timber in an elevated beam or girder structure supported by an open, braced trestle on timber bents. Bridge beams are constructed from logs, sawn lumber, or glued-laminated timber. The timber trestle was one of the earliest known standard bridge plans developed by state engineers in 1917.

The timber mud sill is similar to a timber trestle, with a treated timber stringer or beam superstructure. Rather than the pilings typical of a trestle, the timber mud sill bridge is supported on spread timber footings, known as "mud sills," that distribute the bridge load. Mud sill standard plans were developed for LHC use in the 1930s and 1940s.

With timber bridges, historic integrity is generally diminished because most have structural members replaced over time and do not retain substantial original materials. Louisiana has 1,089 known extant timber trestle bridges, representing 24% of extant pre-1971 bridges. Louisiana's timber bridges are small, simple structures that lack engineering distinction. No examples are considered to be significant, and all lack integrity due to replacement of timber members due to deterioration.

(8) Truss

Truss bridges typically have two parallel trusses that use diagonal and vertical members for deck support. Though not uncommon historically, few truss bridges are extant in Louisiana today. Two broad subtypes are the pony and through truss. Truss bridges are further distinguished by the configuration of truss members. The earliest known standard plan for a truss bridge is a 1917 design for a 48-foot timber truss span. Over the course of the 1920s, the LHC produced a number of standard plans for both pony and through trusses as detailed below. The last known standard truss plan is a 1946 design for a 320-foot-long Camelback span (none extant). Thereafter, the state continued to revise existing truss plan sets. Louisiana has few trusses remaining and only a handful can be associated with any particular standard plan.

(a) Pony truss

Pony (or low) truss bridges are a distinctive truss bridge subtype. They consist of the following design features:

- Superstructure that uses two parallel trusses composed of diagonal and/or vertical members to support deck loads.
- Parallel trusses connected by transverse beams beneath the deck without overhead bracing.
- Bridge members joined with plates and fasteners: pins and rivets in early examples, and bolts in later examples.

While early truss bridges in Louisiana were constructed of wood, all extant examples in the state are metal. Early examples in the state are considered to be those constructed before 1920, the time at which the state's first-known standardized plans for metal pony truss bridges were prepared. The state continued to refine these plans and introduce standard plans for new variations through the 1940s. Louisiana has nine pony truss bridges (including six previously listed or determined eligible) constructed between 1921 and 1950.

Pony truss bridges in Louisiana are constructed in one of two truss configurations: the Pratt and Warren truss, which are distinguished by the arrangement of their diagonal and vertical members. The Pratt truss uses verticals in compression and diagonals in tension, their arrangement mirrored around the central panel in which two diagonals cross. The Warren truss uses diagonal members in alternating directions, relying on the diagonals to withstand both tensile and compressive forces. Warren trusses sometimes also include verticals, though these are primarily for bracing rather than load-bearing purposes.

Alterations affecting historic integrity of this bridge type include:

- Change in railing/parapet, considered minor.
- Addition of supplemental superstructure members, considered minor where truss retains its original function.
- Removal or alteration of individual truss members, floorbeams, or connections, considered minor.

Pony truss – application of *Criterion C* areas of significance

(b) Through truss

Through truss bridges are a distinctive truss bridge subtype. They consist of the following design features:

- Superstructure that uses parallel trusses composed of diagonal and/or vertical members to support deck loads.
- Parallel trusses with lateral bracing between top chords of the trusses.
- Bridge members joined with plates and fasteners: pins, rivets, or bolts in early examples and welding in later examples.

While some early truss bridges in Louisiana were constructed of wood, all extant examples are metal. The earliest metal examples featured the use of pin connections. Pin connections were gradually replaced by riveted connections in the early twentieth century. Early through truss examples in Louisiana are considered to be those with pinned primary connections constructed before 1921, the time at which the state compiled its first known standardized plans for metal through truss bridges with riveted connections. The state continued to refine these plans and introduce standard plans for new variations through the 1950s.

Through truss bridges in Louisiana are constructed in various configurations: the Pratt, Camelback, Warren, and K-truss, which are distinguished by the arrangement of their diagonal and vertical members. The Pratt truss uses verticals in compression and diagonals in tension, their arrangement mirrored around the central panel in which two diagonals cross. The Camelback variation of the Pratt configuration includes a five-sloped polygonal top chord. The Warren truss uses diagonal members in alternating directions, relying on the diagonals to withstand both tensile and compressive forces. Warren trusses sometimes also include verticals, though these are primarily for bracing rather than load-bearing purposes. In the K-truss configuration, vertical and diagonal members form the characteristic "K" shape in each panel, arranged symmetrically around the truss's centerpoint, and a polygonal top chord is typical. The K-truss is unique in that it transfers equal amounts of loading to all its individual members. While the Warren and Pratt variations were developed in the nineteenth century and were common in the U.S., the K-truss was developed in the early twentieth century and was never a popular subtype nationally.

While multiple simple spans are sometimes used at longer crossings, through truss bridges may also utilize a continuous or cantilever design. The use of cantilever and continuous designs allows for the construction of bridges with significant lengths and a wider clear channel. The continuous design is characterized by the use of a single truss span carried across multiple piers. The cantilever design uses two self-supporting spans that meet in the center, sometimes incorporating a suspended central span. A distinctive variation within this design seen in one example is the cantilever truss with a tied-arch suspended span, in which two arched cantilever arms are joined at their apex and a horizontal deck is suspended below.

While the state developed a number of standard plans for simple through truss bridges using the Warren, Pratt, Parker, and Camelback configurations, these were typically 100 to 400 feet in span length. The K-truss, considered to be the lightest truss for its length, could be used to provide longer spans; examples in Louisiana range from 500 to 608 feet in length. The 608-foot K-truss is the longest standard plan developed by the state for a simple through-truss; one example of this plan is known to have been built and remains extant.

Caisson construction was employed at crossings where riverbed conditions were conducive to scour or soils were unstable and difficult to work with. A caisson is a large watertight box or casing built of timber, masonry, reinforced concrete, or steel that enables construction of the pier foundation below water level. The box is then filled with concrete or other material to form the foundation. The method is generally employed where large structures require deep piers, and was important to the construction of a number of truss bridges at long crossings, such as the Mississippi River and Atchafalaya Basin.

Louisiana has 22 through truss bridges (including nine listed or previously determined eligible) constructed between 1900 and 1968. Each configuration is represented by five or fewer examples statewide, the least common being the cantilever K-truss, Waddell A-truss, continuous Warren, and continuous Pratt trusses (one example each). The Pennsylvania truss and the simple Warren,

Camelback, and K-truss configurations are represented by two examples each, and the remainder are cantilever Warren (3) and simple Pratt (5) examples.[17]

Alterations affecting historic integrity of this bridge type include:

- Removal or alteration of individual truss members and connections, considered minor.
- Replaced approach and/or substructure, considered minor.
- Relocation, considered minor.
- Change or addition to rail or guardrail, considered minor.

Through truss – application of *Criterion C* areas of significance

Criterion C category	Subcategory	Feature
Distinctive characteristics of a type, period, or method of construction	Early use of type in state	Pre-1921 with pinned primary connections (prior to earliest standard plans)
	Distinctive design features or subtype	Through truss
	Innovative or complex technological solution related to site, including foundation and substructure design for this type	Caisson construction for substructure Cantilever/continuous spans
	Application of new material or technology for this type	N/A
	Evolution or variation within this bridge type	Pratt truss Warren truss K-truss Camelback truss Cantilever truss with a tied-arch suspended span
High artistic value	Selected ornamentation, notable but isolated	N/A
	Outstanding ornamentation or overall architectural treatment	N/A
Work of a master		N/A

[17] A third non-cantilever K-truss (Recall No. 039320) is currently being replaced and will soon be nonextant.

D. Post-1945 common types (*Program Comment)*

(1) *Criterion A*

Common post-1945 bridges in Louisiana found to have exceptional significance and meet National Register eligibility under *Criterion A*, applying the *Program Comment*, represent the following:

- Bridges that are an important part of the transportation network as a major river crossing that eliminated a former ferry crossing.
- Bridges directly associated with larger conservation efforts to manage flooding.
- Bridges that provide uninterrupted vehicular access over a significant floodplain.

(2) *Criterion C*

A large number of common post-1945 steel and concrete bridges do not meet the requirements set forth in the *Program Comment* for exceptional significance, and therefore are not eligible for the National Register. This includes culverts, concrete slabs, concrete beams and girders, and steel beams and girders that lack engineering distinction and were built in substantial numbers, typically following standard plans, both nationally and in Louisiana. I-beam bridges, designed with spans that could be removed from their location, are a variation of the common I-beam bridge. Post-1945 I-beam bridges with removable spans are not considered exceptionally significant and are not eligible.

Common post-1945 bridges in Louisiana found to have exceptional significance represent the following:

- Bridges with an exceptional main span length, based on an analysis of bridge data.
- Bridges that display innovative or complex technological solutions related to site conditions, allowing for a longer span.
- Bridges that represent an early example of its type in the state, such as the early use of prestressed concrete in Louisiana in the late 1950s and early 1960s.
- Bridges that were engineered for unique site conditions, such as those bridges that span wide water features, are integrated with spillway structures, or that include special design features due to geometric constraints.

Appendix A. List of Interim Reports

THIS PAGE INTENTIONALLY LEFT BLANK

Appendix A. Interim Reports

The following reports were prepared by Mead & Hunt as part of the Louisiana Historic Bridge Inventory project to evaluate the state's historic bridges constructed through 1970.

The *Historic Context for Louisiana Historic Bridge Inventory,* November 2012
The context report presents an understanding trends and developments in Louisiana bridge design engineering through 1970. The contexts and themes provide the basis for developing criteria for evaluating the state's bridges based on the standards of the National Register of Historic Places (National Register). (The context is available on the project website at: http://www.dotd.la.gov/administration/public_info/projects/historicbridges/)

Bridge Stratification and Data Collection Methodology, December 2012
The stratification report outlines the stratification methodology that was used to identify bridges that require further data collection to determine whether they meet eligibility criteria for National Register listing. A data collection process was identified for groups of bridges based on date needs.

National Register Criteria for Evaluation of pre-1971 Louisiana Highway Bridges (draft), December 2012
The evaluation report sets forth criteria for evaluation of individual bridges applying National Register Criteria to identify potential significance and assess historic integrity.

Bridge Stratification Results, Bridges Recommended for Field Survey, January 2012
This report provides the results of the application of the *Bridge Stratification and Data Collection Methodology*, including recommendations of bridges for field survey and bridges that are recommended not eligible based on data review to date.

Assumption Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
051390 61040050200001	LA0182	BAYOU BOEUF	Steel Plate Girder	1958	State of Louisiana	Open	N/A

This continuous steel plate girder main span displays innovative or complex technological solutions related to site conditions, which required a longer span. The steel plate girder consists of built-up welded plates with a deep web that lies between the top and bottom flanges, which are fabricated by plate steel placed horizontally over the webs of the girder. A continuous plate girder span is uninterrupted over one or more intermediate supports, resulting in less materials and deflection and requiring additional engineering to reduce the stresses within the span. The bridge also has exceptional main span length with three continuous plate girders, consisting of two 150-foot girders and one 200-foot girder together forming a 500-foot-long span. The continuous steel plate girder bridge retains good integrity, and despite being a common type conveys exceptional significance and is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

051500 61042320113011	LA0070	PIERRE PART BAYOU	Steel Plate Girder Swing Span	1967	State of Louisiana	Open	N/A

This steel plate girder swing bridge has significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of the steel plate girder swing type, which is characterized by steel plate girder main span, center-bearing turning mechanism, pivot pier, and operator's house. The bridge exhibits alterations to the operator's house that result in a minor loss of integrity, but continues to convey significant design features of this subtype. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

036520 08058051901631	LA1177	BAYOU BOEUF	Steel Low Truss (Pony Truss)	1921	State of Louisiana	Open	N/A
This bridge has been previously determined eligible for listing in the National Register.							
800106 P0531085920971	CARDINAL LOOP ROAD	CHOCTAW BAYOU	Concrete Deck Girder	1921	Parish Highway Agency	Open	N/A
This bridge has significance as an early example and variation of the concrete deck girder subtype in Louisiana. It is one of two concrete deck girder bridges constructed prior to the development of standard plans for concrete deck girders in 1922, and therefore distinctly represents early use of this bridge type in the state. This bridge retains good integrity and clearly conveys the significant design features within its type. It is eligible for listing in the National Register under Criterion C: Design/Engineering. No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.							
XXXX03	Closed road	Bayou Des Glaises	Steel Low Truss Swing Span	1916		Open	N/A
This bridge is listed in the National Register.							

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

Appendix D1 - Eligible, Previously Determined Eligible, and Listed Pre-1971 Bridges

Bossier Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
012060 04080010300001	US0080	RED RIVER	Steel High Truss (Cantilevered Through Truss)	1934	State of Louisiana	Open	Yes: Shreveport Commercial Historic District

This through truss bridge has significance as an important example of a distinctive truss subtype. It conveys its engineering significance through the use of a K-truss configuration characterized by the arrangement of vertical and diagonal members to form a “K” in each truss panel. In addition, the bridge displays innovative or complex technological solutions related to its site conditions, which consist of an arched cantilever main span and caisson pier construction to meet the challenges of crossing the Red River. The K-truss is a rare variation both nationally and in Louisiana; this bridge is the only example in Louisiana to also incorporate a cantilevered span. This bridge exhibits added beam guard, resulting in a minor loss of integrity, but is able to convey the significant design features of the through K-truss. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

012160 04080010310271	US0080	BAYOU FIFI	Concrete Deck Girder	1934	State of Louisiana	Open	N/A

This concrete deck girder bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with the National Industrial Recovery Act (NIRA) program during the Depression-era to provide work relief and improved infrastructure. Bridge construction was part of New Deal federal-relief efforts during the Depression. A plaque on the bridge identifies it as a federal aid project and Louisiana Highway Commission Biennial reports document that it was a Depression-era work-relief project. The bridge exhibits alterations to the railing that results in a minor loss of integrity, but continues to convey its significance as the work of the NIRA. This bridge is eligible for the National Register under Criterion A: Politics/Government.

No evidence was found during research or data collection activities to indicate that this bridge is an important example of bridge design, engineering, or construction. This bridge does not possess significance under Criterion C.

012200 04080010316232	US0080	CLARKE BAYOU	Concrete Box Culvert	1930	State of Louisiana	Open	N/A

This concrete box culvert has significance as an important example of a technological solution to particular site conditions. Significance is demonstrated by the presence of distinctive design features, which consist of a double decker, multi-unit box design. This unique design, where two rows of box culvert barrels are stacked, allowed for the relatively inexpensive culvert form to be used without flooding on the roadway. The culvert is able to convey its significant design features and is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this culvert possesses a direct and important association with historical events or trends. This culvert does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

Appendix D1 - Eligible, Previously Determined Eligible, and Listed Pre-1971 Bridges

Bossier Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
012548 04080830300001	LA0002	RED RIVER-MILLER'S BLUFF	Steel High Truss (Simple Through Truss)	1952	State of Louisiana	Open	N/A

This Warren through truss bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as a major river crossing that eliminated a former ferry crossing. The bridge is the first vehicular crossing of the Red River at this location. The bridge was constructed by the Louisiana Department of Highways in 1952 to provide uninterrupted east-west highway through the northern portion of Louisiana. Carrying LA 2, this bridge constitutes the only crossing of the Red River in Louisiana north of Shreveport.

This bridge also possesses significance as an example of a distinctive truss bridge subtype. Significance is demonstrated by the presence of distinctive features of the Warren through truss, consisting of five spans characterized by diagonal members to withstand both tensile and compressive forces. This example has added verticals for bracing. This bridge was built to a state standard plan (SHT-35-15). This bridge exhibits an added concrete guardrail, resulting in a minor loss of integrity, but continues to clearly convey design features that demonstrate its significance as a major river crossing and as a distinctive truss bridge subtype. This bridge is eligible for the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

012750 04081020300001	LA0511	RED R.,C.FANT PKWY,AR TEA	Steel High Truss (Simple Through Truss)	1968	State of Louisiana	Open	N/A

This through truss bridge has significance as an example of a distinctive truss subtype. Significance is demonstrated by the presence of distinctive features of the Warren through truss, consisting of three spans characterized by diagonal members to withstand both tensile and compressive forces. This example has added verticals for bracing and a polygonal top chord. This bridge exhibits new concrete guardrail that results in a minor loss of integrity but is able to convey its significant design features. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

Appendix D1 - Eligible, Previously Determined Eligible, and Listed Pre-1971 Bridges

Caddo Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
013480 04090010209141	US0080	KCS RR	Concrete Deck Girder	1927	State of Louisiana	Open	N/A

This bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade-separation structure is directly related to early initiatives by the state to provide safe railroad-highway crossings. Beginning in the 1920s, the state placed increased attention on creating grade separations between railway lines and roads and this bridge is an early example of those efforts. The bridge exhibits alterations to the light posts that results in a minor loss of integrity, but continues to convey its significance as an early grade separation structure. This bridge is eligible for the National Register under Criterion A: Transportation.

No evidence was found during research or data collection activities to indicate that this bridge is an important example of bridge design, engineering, or construction. This bridge does not possess significance under Criterion C.

013970 04090450112421	LA0001	CADDO LAKE	Steel Low Truss (Pony Truss)	1940	State of Louisiana	Open	N/A

This bridge has been previously determined eligible for listing in the National Register.

014400 04090530908941	US0071	ICG RR	Concrete Deck & Bents w/ Steel I-Beam	1937	State of Louisiana	Open	Yes: Shreveport Commercial Historic District

This bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade separation structure is directly related to its funding through the U.S. Works Program Grade Crossing program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). The U.S. Works Grade Crossing Program resulted from the Emergency Relief Appropriation Act funding. A plaque on the bridge identifies it as a federal aid project and this project is also documented in the Louisiana Highway Commission Biennial reports. The bridge retains good integrity and clearly conveys the significant features to demonstrate its significance as the work of the Emergency Relief Appropriation Act. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation.

No evidence was found during research or data collection activities to indicate that this bridge is an important example of bridge design, engineering, or construction. This bridge does not possess significance under Criterion C.

014410 04090530908942	US0071	ICG RR	Concrete Deck & Bents w/ Steel I-Beam	1940	State of Louisiana	Open	Yes: Shreveport Commercial Historic District

This steel I-beam bridge has significance in its outstanding overall architectural treatment. Its significance is derived from a combination of decorative features that together create an aesthetic distinguished within the bridge type. The bridge features decorative metal railing, angular pier cap design, tapered brackets under the sidewalks, and geometric end posts, which as a whole conveys high artistic value. This bridge retains good integrity and clearly conveys the significant design features within its type. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

Appendix D1 - Eligible, Previously Determined Eligible, and Listed Pre-1971 Bridges

Calcasieu Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
031450 07100030405781	US0090	US 90 OVER I-10/RAMPS	Steel Plate Girder	1959	State of Louisiana	Open	N/A

This bridge has four main plate girder spans: two are 150 feet and two are 175 feet, which are considered exceptional main span lengths for steel plate girder bridges. Steel plate girders consist of built-up welded plates with a deep web that lies between the top and bottom flanges, which are fabricated by plate steel placed horizontally over the webs of the girder. The bridge piers also display innovative or complex technological solutions related to geometric constraints. The main span features framed steel pier caps, with tapered steel plate girders that frame into the steel piers, which are attached to the concrete foundations by hold-down anchors that resist uplift for loads on the pier. The bearings consist of semi-circular castings supported in steel U-shaped steel supports that are bolted to the stiffeners of the pier cap. The narrow configuration of the pier, along with the fabricated steel construction of the pier shaft and cap and the hold-down anchor attachments to the concrete foundations, further lend to the engineering complexity of this bridge. In addition, the framing system allows for a lower vertical profile for the bridge and provides for a reduced “footprint” for the piers. The bridge retains good integrity, and despite being a common type conveys exceptional significance and is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

031530 07100120100001	LA0012	SABINE RIVER	Steel Plate Girder Swing Span	1936	State of Louisiana	Open	N/A

This bridge is listed in the National Register.

031736 07100240103501	US0171	CALCASIEU RIVER	Steel Plate Girder	1969	State of Louisiana	Open	N/A

This steel plate and concrete girder bridge has five main plate girder spans. Two are 150 feet and three are 200 feet, which are considered exceptional main span lengths for steel plate girder bridges. Steel plate girders consist of built-up welded plates with a deep web that lies between the top and bottom flanges, which are fabricated by plate steel placed horizontally over the webs of the girder. The bridge also has a notable overall length of 5,702 feet. The bridge retains good integrity, and despite being a common type conveys exceptional significance and is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

032780 07104509127691	I0010	CALCASIEU RIVER, RR, STS.	Steel High Truss (Cantilevered Through Truss)	1951	State of Louisiana	Open	N/A

This bridge has been previously determined eligible for listing in the National Register.

033353 07108101204221	LA0378	W FORK CALCASIEU RIVER	Steel Vertical Lift Span	1968	State of Louisiana	Open	N/A

This tower drive with connected towers vertical lift bridge has significance as a movable bridge and as an important variation within the vertical lift bridge type. This variation is demonstrated in the location of the drive machinery at the center of a fixed span that operates the four sheaves. This configuration is uncommon nationally and represents a variation based on the small size of the navigation channel and necessary span length. The bridge retains good integrity and clearly conveys the significant design features of this variation within the bridge type. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

Calcasieu Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
500271 P1030141931501	LOCAL ROAD	GUM SLOUGH	Concrete rigid frame	1935	Parish Highway Agency	Open	N/A

This bridge has significance as an important example of concrete rigid frame construction, a distinctive and rare type in Louisiana. The distinguishing feature of rigid frame construction is the integration of substructure and superstructure components into a single cast-in-place unit, which this bridge clearly exhibits. The small sections of the historic concrete railing that are missing result in only a minor loss of integrity, as the bridge continues to convey the significant design features of its type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

033700 07121940200001	LA0082	MERMENTAU R./G.CHENIER	Steel Low Truss Swing Span	1959	State of Louisiana	Open	N/A

This Warren pony truss swing bridge has significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of a pony truss swing bridge, which is characterized by the Warren truss configuration, center-bearing turning mechanism, pivot pier, and operator's house. The bridge exhibits alterations to the operator's house that result in a minor loss of integrity, but continues to convey significant design features of this subtype. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

033730 07121940221101	LA0082	SUPERIOR CANAL	Steel Low Truss Swing Span	1956	State of Louisiana	Open	N/A

This Warren pony truss swing bridge has significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of a pony truss swing bridge, which is characterized by the Warren truss configuration, center-bearing turning mechanism, pivot pier, and operator's house. The bridge exhibits alterations to the operator's house that result in a minor loss of integrity, but continues to convey significant design features of this subtype. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

Appendix D1 - Eligible, Previously Determined Eligible, and Listed Pre-1971 Bridges

Concordia Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
048070 58150260100001	US0065	MISSISSIPPI RIVER	Steel High Truss (Cantilevered Through Truss)	1940	State of Louisiana	Open	N/A
This bridge has been previously determined eligible for listing in the National Register.							
1770309321	LA0015	OLD RIVER LOW SILL C.S.	Steel stringer/multi-beam or girder	1959	Corps of Engineers (Civil)	Open	N/A
This steel stringer bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Conservation as a bridge that is part of an integrated spillway structure (overbank structure) that was constructed as part of a larger conservation effort constructed as part of a larger conservation effort. The bridge and spillway were constructed to prevent the Mississippi River from diverting into the Atchafalaya River, which could dramatically change the landscape in south-central and southeastern Louisiana, as well as displace communities and industries served by the rivers. This bridge and spillway is also related to managing flooding within the region. This bridge is one of two spillways (the other bridge with integrated spillway is Recall No. F15771), and navigational canal that make up the larger Old River Control Structure. Although constructed in 1959 and considered a common type, this bridge possesses exceptional significance for its distinctive engineering and design features. The bridge is part of an integrated spillway structure that spans 977 feet. Significant engineering went into this bridge, which incorporates two different components: a vehicular bridge and a spillway structure that consists of a series of flood control gates that control a large quantity of water. The bridge exhibits alterations that result in a minor loss of integrity, including reconstruction of a wing wall and riprap to prevent scouring under the spillway after it collapsed during the Flood of 1973. The bridge continues to convey design features that demonstrate its significance as an integrated structure that is part of a larger conservation effort and as a distinctive example of engineering. The bridge is eligible for the National Register under Criterion A: Conservation and Criterion C: Design/Engineering.							
581501770309771	LA0015	OLD RIVER OBANK C.S.	Concrete stringer/multi-beam or girder	1959	Corps of Engineers (Civil)	Open	N/A
This concrete girder bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Conservation as a bridge that is part of an integrated spillway structure (overbank structure) that was constructed as part of a larger conservation effort. The bridge and spillway were constructed to prevent the Mississippi River from diverting into the Atchafalaya River, which could dramatically change the landscape in south-central and southeastern Louisiana, as well as displace communities and industries served by the rivers. This bridge and spillway are also related to managing flooding within the region. This bridge is one of two spillways (the other bridge integrated with a spillway is recall number F15321) and a navigational canal that make up the larger Old River Control Structure. Although constructed in 1959 and considered a common type, this bridge also possesses exceptional significance for its distinctive engineering and design features. The bridge is part of an integrated spillway structure that spans 3,504 feet. Significant engineering went into this bridge, which incorporates two different components: a vehicular bridge with a notable overall span length to span the water feature and a spillway structure that consists of a series of flood control gates that control a large quantity of water. The bridge retains good integrity and clearly conveys design features that demonstrate its significance as an integrated structure that is part of a larger conservation effort and as distinctive example of engineering. The bridge is eligible for the National Register under Criterion A: Conservation and Criterion C: Design/Engineering.

This bridge has been previously determined eligible for listing in the National Register.							
052140 61170770400001	LA0073	BAYOU MANCHAC	Steel Low Truss (Pony Truss)	1931	State of Louisiana	Open	N/A
This pony truss bridge has significance as an example of a distinctive truss subtype. The distinctive features that convey its engineering significance are its three Warren truss spans, comprised of diagonal members to withstand both tensile and compressive forces. The bridge appears to conform to state standard plan (S-L-T-35). This bridge exhibits added guardrail that results in a minor loss of integrity but is able to convey its significant design features. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering. No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.							
610023 U1730258910961	CITY STREET	K.C.S. RR	Concrete Deck & Bents w/ Steel I-Beam	1937	Parish Highway Agency	Open	N/A
This steel I-beam bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade-separation structure is directly related to its funding through the U.S. Works Program Grade Crossing Program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). The U.S. Works Grade Crossing Program resulted from the Emergency Relief Appropriation Act funding. This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission biennial reports. This bridge also possesses significance in its outstanding overall architectural treatment. Its significance is derived from a combination of decorative features that together create an aesthetic distinguished within the bridge type. The bridge features decorative concrete railing, angular pier cap design, tapered brackets under the sidewalks, and geometric end posts, which as a whole conveys high artistic value. The bridge retains good integrity and clearly conveys design features that demonstrate its significance as a work funded through the Emergency Relief Appropriation Act and a structure with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation and under Criterion C: Design/Engineering.							

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

700682 P2231280923681	LOCAL ROAD	MARTEAU BAYOU	Concrete Deck Girder	1919	Parish Highway Agency	Open	N/A

This bridge has significance as an early example of the concrete deck girder subtype in Louisiana. It is one of two concrete deck girder bridges constructed prior to the development of standard plans for concrete deck girders in 1922, and therefore distinctly represents early use of this bridge type in the state.
This bridge retains good integrity and clearly conveys the significant design features within its type. It is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

005800 03232370100141	LA0086	BAYOU TECHE	Steel Plate Girder Bascule Span	1940	State of Louisiana	Open	Yes: East Main Street Historic District

This double-leaf trunnion bascule bridge with steel plate girder spans has significance as a distinctive example of the bascule type. Its significance is demonstrated by the presence of distinctive engineering and design features of the double-leaf trunnion bascule bridge type, which is characterized by two opposing leaves that rotate around trunnions, racks and pinions for moving each span, counterweights that descend into enclosed pits, and locking mechanisms that enable the cantilevered spans to withstand live loads and remain stable when in closed position. The bridge exhibits alteration to the operator's house that results in a minor loss of integrity, but continues to convey significant design features of this bridge type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

006210 03238231406331	LA0344	TECHE BAYOU	Steel Vertical Lift Span	1964	State of Louisiana	Open	N/A

This tower drive with connected towers vertical lift bridge has significance as a movable bridge and as an important variation within the vertical lift bridge type. This variation is demonstrated in the location of the drive machinery at the center of a fixed span that operates the four sheaves. This configuration is uncommon nationally and represents a variation based on the small size of the navigation channel and necessary span length. The bridge exhibits alterations to the operator's house that result in a minor loss of integrity, but continues to convey the significant design features of this variation within the vertical lift type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

This bridge is listed in the National Register.

200901 P2329573914291	LOCAL ROAD	TECHE BAYOU	Steel Low Truss Swing Span	1930	Other State Agency	Open	N/A

This pony truss swing bridge has significance as an example of a movable bridge, as well as an important variation within the swing bridge type. Distinctive features that demonstrate this variation include its variable-depth Warren truss superstructure configuration with separate trusses for each swing arm, connected with pinned horizontal members. Its significance is further demonstrated in its manually operated swing mechanism, which is an important variation within the type. The bridge retains good integrity and clearly conveys the significant design features of this variation within the bridge type. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

001304 02298291400791	LA0655	BAYOU LAFOURCHE	Steel Plate Girder Swing Span	1940	State of Louisiana	Open	N/A

This steel plate girder swing bridge has significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of the steel plate girder swing type, which is characterized by steel plate girder main span, center-bearing turning mechanism, pivot pier, and operator's house. This particular example also features a variable-depth girder. Based on as-built plans, it appears that a state standard plan (SS-33) served as a general guide for the design and construction of this bridge. The bridge retains good integrity and clearly conveys the significant design features of this subtype. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

200860 P2929438903641	LOCAL ROAD	LAFOURCHE BAYOU	Steel Vertical Lift Span	1968	Parish Highway Agency	Open	N/A

This tower drive with connected towers vertical lift bridge has significance as a movable bridge and as an important variation within the vertical lift bridge type. This variation is demonstrated in the location of the drive machinery at the center of a fixed span that operates the four sheaves. This configuration is uncommon nationally and represents a variation based on the small size of the navigation channel and necessary span length. The bridge retains good integrity and clearly conveys the significant design features of this variation within the bridge type. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

200863 P2929355902801	LOCAL ROAD	LAFOURCHE BAYOU	Pontoon Bridge	1969	Parish Highway Agency	Open	N/A

This pontoon swing bridge has significance as a distinctive example of a movable bridge. Its significance is demonstrated by the presence of distinctive engineering and design features of the pontoon swing bridge type, which is characterized by a floating pontoon span, pivot arm, and mechanical systems to operate the movement of the pontoon and approach aprons. The bridge exhibits alterations to the operator’s house and railing that result in a minor loss of integrity, but continues to convey the significant design features of the type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

200886 P2929260901781	LOCAL ROAD	LAFOURCHE BAYOU	Pontoon Bridge	1956	Parish Highway Agency	Open	N/A

This pontoon swing bridge has significance as a distinctive example of a movable bridge. Its significance is demonstrated by the presence of distinctive engineering and design features of the pontoon swing bridge type, which is characterized by a floating pontoon span, pivot arm, and mechanical systems to operate the movement of the pontoon and approach aprons. The bridge exhibits alterations to the operator’s house that result in a minor loss of integrity, but continues to convey the significant design features of the pontoon swing bridge type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

056360 62322600200001	LA0042	AMITE RIVER	Steel Plate Girder Swing Span	1963	State of Louisiana	Open	N/A

This steel plate girder swing bridge has significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of the steel plate girder swing type, which is characterized by steel plate girder main span, center-bearing turning mechanism, pivot pier, and operator's house. This particular example also features a variable-depth girder. The bridge exhibits alterations to the operator's house and railing that result in a minor loss of integrity, but continues to convey significant design features of this subtype. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

400345 P3332300911891	LOCAL ROAD	TENSAS RIVER	Steel Low Truss (Pony Truss)	1950	Parish Highway Agency	Open	N/A
This pony truss bridge has significance as an example of a distinctive truss subtype. The bridge's significant design features are its three Warren truss spans, characterized by diagonal members to withstand both tensile and compressive forces. This example has added verticals for bracing. This bridge exhibits welded alterations to the floor beams that result in a minor loss of integrity, but the bridge is able to convey its significant design features. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering. No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.							
000043690-00025	OLD HWY 80	JUDD BAYOU	Steel High Truss (Simple Through Truss)	1908	Bureau of Fish and Wildlife	Open	N/A
This through truss bridge has significance as an important example of a distinctive truss subtype and for its method of construction. The bridge's significant design feature is its Pratt truss, characterized by vertical members in compression and diagonals in tension with a crossbar system in the central panel. The bridge displays pinned primary connections; this construction method is only found on early bridges of which two examples were identified statewide. This bridge exhibits replacement substructure and approach spans, resulting in a minor loss of integrity. Because the truss itself is intact, the bridge continues to convey its significant design features. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering. No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

023620 05340160509191	US0165	MISSOURI PACIFIC RAILROAD	Concrete Deck & Bents w/ Steel I-Beam	1938	State of Louisiana	Open	N/A

This steel I-beam bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade separation structure is directly related to its funding through the U.S. Works Program Grade Crossing program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). The U.S. Works Grade Crossing Program resulted from the Emergency Relief Appropriation Act funding. This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission Biennial reports. The bridge exhibits alterations to the railing with the addition of guardrail that results in a minor loss of integrity, but continues to convey its significance as the work of the Emergency Relief Appropriation Act. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation.

No evidence was found during research or data collection activities to indicate that this bridge is an important example of bridge design, engineering, or construction. This bridge does not possess significance under Criterion C.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

XXXX02	Closed Road	Cane River Lake	Steel High Truss (Simple Through Truss)	1912	Other Local Agency	Closed	N/A

This through truss bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as an important local crossing. The Cane River Bridge, constructed in 1912, replaced an earlier ferry and provided a crossing that allowed more reliable access to railroad connections for the community that had previously been interrupted by flooding.

The bridge also possesses significance as an important example of a distinctive subtype of truss bridge and for its method of construction. The distinctive features that convey its engineering significance are its three Pratt truss spans, which are characterized by vertical members in compression and diagonals in tension with a crossbar system in the central panel. The Cane River Bridge displays pinned primary connections; this construction method is only found on early bridges of which only two examples were identified statewide. This bridge exhibits a replacement substructure and added guardrail, resulting in a minor loss of integrity, but continues to convey design features that demonstrate its significance as an essential local river crossing and as an important truss bridge subtype with a distinctive method of construction. This bridge is eligible for the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

001570 U3629578900151	CITY STREET	INDUSTRIAL CANAL	Steel Plate Girder Bascule Span	1919	Other Local Agency	Open	Yes: Holy Cross Historic District
This Strauss trunnion bascule bridge with truss superstructure has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as an important crossing built to span the Industrial Canal in New Orleans. The canal opened in 1923 to connect Lake Pontchartrain with the Mississippi River and allows access for cargo ships and barges to river wharves. Completed in 1919, this is one of the four original bascule bridges built to cross the canal (three are extant). The bridge also possesses significance as a distinctive subtype within the bascule bridge type. Distinctive engineering features include its heel trunnion patented design. The bridge was also engineered with a truss superstructure to carry rail and vehicular traffic over the Industrial Canal, features that further convey its engineering and design significance. The bridge exhibits alterations with the removal of railroad tracks and deck replacement that result in a minor loss of integrity, but continues to convey design features that demonstrate its significance as an important crossing along New Orleans' Industrial Canal and as a distinctive bascule bridge subtype. This bridge is eligible for the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.							
001630 02361480201061	LA0047	INTRACOASTAL WATERWAY(GULF OUTLET)	Steel High Truss (Cantilevered Through Truss)	1967	State of Louisiana	Open	N/A
This through truss bridge has significance as an important example of a distinctive type of truss bridge. Significance is demonstrated through an innovative or complex technological solution related to site conditions, consisting of the use of a cantilever truss with a tied-arch suspended span to meet the challenges of crossing the Gulf Outlet Canal. Significance is also demonstrated by the presence of distinctive features of the Warren through truss, which is characterized by diagonal members to withstand both tensile and compressive forces. This example has added verticals for bracing. This bridge exhibits a replacement parapet on one approach span that results in a minor loss of integrity, but is able to convey its significant design features. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering: Design/Engineering. No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A							
020375 02360463102341	LA0039	CLAIBORNE BRIDGE	Steel Vertical Lift Span	1957	State of Louisiana	Open	N/A
This tower drive vertical lift bridge with Warren through truss main span has significance as a movable bridge and as an important variation within the vertical lift bridge type. Distinctive engineering features that convey this variation include the location of two separate motor and drive mechanisms, which power the two sheaves on each tower. The bridge exhibits in-kind replacement of stringers and the grid deck and alterations to the operator's house that result in a minor loss of integrity, but continues to convey significant design features of this variation within the vertical lift type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering. No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

102113 U3630002900581	LOCAL ROAD	CITY PARK LAGOON	Concrete Arch	1937	City or Municipal Highway Agency	Open	N/A

This reinforced concrete arch bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with the Works Progress Administration (WPA) program to provide work relief and improved infrastructure during the Depression era. Between 1936 and 1939 the WPA constructed eight reinforced concrete arch bridges and one rigid frame bridge in New Orleans's City Park featuring Classical Revival and Art Deco stylized influences typical of the period. Each bridge features "WPA" in Art Deco style letters in the concrete endposts. Bridge construction was part of New Deal federal-relief efforts by the WPA, Public Works Administration (PWA), Civil Works Administration (CWA), and Federal Emergency Relieve Administration (FERA) during the Depression in City Park that included reconfiguration of the park layout and landscaping, sidewalk, road, and building construction.

This bridge also possesses significance as a distinctive bridge type in Louisiana and as an important example of high artistic value. The bridge is one of nine reinforced concrete arches in City Park reflecting the characteristics of closed spandrel arch design. Its significance is further demonstrated by the overall aesthetic treatment reflective of the Art Deco style, which is expressed by geometric patterns, crowned and beveled parapets, a recessed arch ring, integrated benches, and bold font used for the WPA stamp. A bas-relief sculpture of a reclined figure, designed by sculptor Enrique Alferez, enhances this bridge's aesthetics. This bridge retains good integrity and clearly conveys the design features that demonstrate its significance as a work of the WPA and as a distinctive bridge type with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Criterion C: Design/Engineering.

102114 U3630002900571	LOCAL ROAD	CITY PARK LAGOON	Concrete Arch	1937	City or Municipal Highway Agency	Open	N/A

The bridge also possesses significance as a distinctive bridge type in Louisiana and as an important example of high artistic value. The bridge is one of nine reinforced concrete arches in City Park reflecting the characteristics of closed spandrel arch design. Though more modest than other arches in City Park, the combination of features conveys the overall design aesthetic of the Art Deco style, which include the overall structure design, beveled piers and parapets, recessed arch ring, and bold font used for the WPA stamp. As a later example of a reinforced concrete arch in City Park, the bridge reflects the evolution of the Art Deco style as the design aesthetic became simplified and influenced by the Streamlined Moderne style. This bridge retains good integrity and clearly conveys the design features that demonstrate its significance as a work of the WPA and as a distinctive bridge type with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Criterion C: Design/Engineering.

102227 P3629591900571	LOCAL ROAD	CITY PARK LAGOON	Concrete Arch	1924	Local Park, Forest or Reservation Agency	Open	N/A

This reinforced concrete arch has significance as a distinctive bridge type in Louisiana and as an important example of high artistic value. The bridge is one of nine reinforced concrete arches in City Park reflecting the characteristics of closed spandrel arch design. Its significance is further demonstrated by the overall aesthetic treatment reflective of the Classical Revival style, which is expressed by a curved railing with arched posts, decorative carved flowers and inscribed cartouche on the parapet, integrated lamp posts with decorative Revival style lantern, and decorative endposts with integrated concrete urns and recessed panels. This bridge retains good integrity and clearly conveys the significant design features within its type and high artistic value. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

This reinforced concrete arch bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with the Works Progress Administration (WPA) program to provide work relief and improved infrastructure during the Depression era. Between 1936 and 1939 the WPA constructed eight reinforced concrete arch bridges and one rigid frame bridge in New Orleans's City Park featuring Classical Revival and Art Deco stylized influences typical of the period. Each bridge features "WPA" in Art Deco style letters in the concrete endposts. Bridge construction was part of New Deal federal-relief efforts by the WPA, Public Works Administration (PWA), Civil Works Administration (CWA), and Federal Emergency Relieve Administration (FERA) during the Depression in City Park that included reconfiguration of the park layout and landscaping, sidewalk, road, and building construction.

This bridge also possesses significance as a distinctive bridge type in Louisiana and as an important example of high artistic value. The bridge is one of nine reinforced concrete arches in City Park reflecting the characteristics of closed spandrel arch design. Its significance is further demonstrated by the overall aesthetic treatment reflective of the Art Deco style, which is expressed by geometric patterns, inscribed vertical lines, crowned and beveled parapets, a recessed arch ring, integrated lighting, and bold font used for the WPA stamp. This bridge exhibits one alteration that results in a minor loss of integrity, the replacement of an original light fixture in the parapet with a comparable style. This continues to clearly convey design features that demonstrate its significance as a work of the WPA and as a distinctive bridge type with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Criterion C: Design/Engineering.

102234 P3629592900561	LOCAL ROAD	CITY PARK LAGOON	Concrete rigid frame	1938	Local Park, Forest or Reservation Agency	Open	N/A

This concrete rigid frame bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with the Works Progress Administration (WPA) program to provide work relief and improved infrastructure during the Depression era. Between 1936 and 1939 the WPA constructed eight reinforced concrete arch bridges and one rigid frame bridge in New Orleans's City Park featuring Classical Revival and Art Deco stylized influences typical of the period. Each bridge features "WPA" in Art Deco style letters in the concrete endposts. Bridge construction was part of New Deal federal-relief efforts by the WPA, Public Works Administration (PWA), Civil Works Administration (CWA), and Federal Emergency Relieve Administration (FERA) during the Depression in City Park that included reconfiguration of the park layout and landscaping, sidewalk, road, and building construction.

This bridge also possesses significance as an important example of concrete rigid frame construction, a distinctive and rare bridge type in Louisiana, and for possessing high artistic value. The distinguishing feature of rigid frame construction is the integration of substructure and superstructure into a single monolithic, cast-in-place unit, which this bridge clearly exhibits. In addition, this bridge displays architectural treatments and decorative elements that convey the overall design aesthetic of the Art Deco style and make the structure visually distinctive in its urban parkway setting. This includes the haunched span, vertical ribbing and flutes on the posts, curved end walls, and bold font used for the WPA stamp. This bridge retains good integrity and clearly conveys the design features that demonstrate its significance as a work of the WPA and as a distinctive bridge type with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Criterion C: Design/Engineering

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

This bridge also possesses significance as a distinctive bridge type in Louisiana and as an important example of high artistic value. The bridge is one of nine reinforced concrete arches in City Park reflecting the characteristics of closed spandrel arch design. Its significance is further demonstrated by the overall aesthetic treatment reflective of the Art Deco style, which is expressed by geometric patterns, crowned and beveled parapets, a recessed arch ring, and bold font used for the WPA stamp. Bas-relief sculptures of WPA workers employed in construction activities, designed by sculptor Enrique Alferez, enhance this bridge's aesthetics. This bridge retains good integrity and clearly conveys the design features that demonstrate its significance as a work of the WPA and as a distinctive bridge type with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Criterion C: Design/Engineering.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

Appendix D1 - Eligible, Previously Determined Eligible, and Listed Pre-1971 Bridges

Ouachita Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
024400 05370010918151	US0080	OUACHITA RIVER-LOUISVILLE	Steel Plate Girder Bascule Span	1935	State of Louisiana	Open	N/A
This bridge has been previously determined eligible for listing in the National Register.							
024430 05370020103111	US0080	MO PAC RR SICARD	Steel I-Beam (Rolled) - Continuous	1935	State of Louisiana	Open	N/A
This continuous steel rolled I-beam bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade-separation structure is directly related to its funding through the National Industrial Recovery Act (NIRA) program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission biennial reports. The bridge also possesses significance as a variation within this otherwise common bridge type. This bridge consists of three beams spanning uninterrupted over intermediate piers that together form a 181-foot-long continuous span. The presence of a significant main span length represents an innovative or complex solution related to site conditions, which was required to cross a railroad corridor and topography. The bridge exhibits alterations to the substructure with the addition of bent supports that results in a minor loss of integrity, but continues to convey its design features that demonstrate its significance as a structure funded through the NIRA and as a distinctive variation within the bridge type. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation and Criterion C: Design/Engineering.							
XXXX11	LOCAL ROAD	BAYOU DESIARD	Concrete rigid frame	1910	City or Municipal Highway Agency	Closed	N/A
This bridge was formerly identified under recall number 400816. This bridge has significance as an important example of concrete rigid frame construction, a distinctive and rare type in Louisiana. The distinguishing feature of rigid frame construction is the integration of substructure and superstructure components into a single cast-in-place unit, which this bridge clearly exhibits. This bridge has fascia girders that extend above the deck. This bridge retains good integrity and clearly conveys the significant design features within its type. It is eligible for listing in the National Register under Criterion C: Design/Engineering. No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.							

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

Appendix D1 - Eligible, Previously Determined Eligible, and Listed Pre-1971 Bridges

Plaquemines Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
002500 02380620200432	LA0023	I C WATERWAY	Steel Vertical Lift Span	1967	State of Louisiana	Closed	N/A

This tower drive vertical lift bridge has significance as a movable bridge and as an important variation within the vertical lift bridge type. Distinctive engineering features that convey this variation include the location of two separate motor and drive mechanisms, which power the two sheaves on each tower. This bridge appears to conform to a state standard plan (SL50-150-28). The bridge exhibits alterations to the operator's house and replacement of isolated mechanical components and counterweight ropes that results in a minor loss of integrity, but continues to convey the significant design features of this variation within the vertical lift type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

Appendix D1 - Eligible, Previously Determined Eligible, and Listed Pre-1971 Bridges

Pointe Coupee Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
054830 61390080306461	US0190	MORGANZA FLDWY	Concrete Deck Girder	1945	State of Louisiana	Open	N/A

This concrete deck girder bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as an important crossing of the Morganza Floodway. This floodplain was created in the 1940s when the U.S War Department began diverting water from the Mississippi into the Atchafalaya River to prevent flooding of the lower reaches of the Mississippi River. The diversion channels and floodplains crossed existing state highways, preventing any vehicular use during periods of flooding. At the request of the federal government, the Louisiana Highway Department upgraded portions of the effected highways with high-level bridges above the floodplain. The Morganza Floodway Bridge was completed in 1945, and provided uninterrupted access over the Morganza floodplain.

This bridge also possesses significance due to its exceptional overall length. The overall length of this non-continuous, multi-span bridge is nearly 19,000 feet, far exceeding the overall length of all other concrete deck girder bridges. Substantial overall structure length typically indicates challenging site conditions, and thus this bridge is a reflection of the complexity of engineering required for spanning a long distance. The bridge retains good integrity and clearly conveys design features that demonstrate its significance as a floodplain crossing and a structure with significant design features within its type. This bridge is eligible for the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

054850 61390520302671	LA0001	MORGANZA SPILLWAY	Concrete Deck Girder	1954	State of Louisiana	Open	N/A

This bridge has been previously determined eligible for listing in the National Register.

054900 61391770105911	LA0015	OLD RIVER NAV. CANAL	Steel Vertical Lift Span	1964	State of Louisiana	Open	N/A

This tower drive with connected towers vertical lift bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Conservation and Transportation as a vertical lift structure over the Old River Navigation Canal. The bridge and canal were constructed as part of a larger conservation effort to ensure in the late 1950s the Mississippi River would not divert into the Atchafalaya River. The canal was constructed to provide passage of waterway traffic between the Mississippi River and the Atchafalaya River, while the bridge carries LA 15 over the canal. The vertical lift configuration allowed for necessary navigational clearance under the bridge. The bridge and canal are associated with two spillways (related bridges are Recall Nos. F15771 and F15321) that make up the larger Old River Control Structure.

The bridge also possesses significance as a movable bridge and as an important variation within the vertical lift bridge type. This variation is demonstrated in the location of the drive machinery at the center of a fixed span that operates the four sheaves. This configuration is uncommon nationally and represents a variation based on the small size of the navigation channel and necessary span length. The bridge retains good integrity and clearly conveys design features that demonstrate its significance as an integral component of a larger conservation project and as a variation within the vertical lift bridge type. This bridge is eligible for the National Register under Criterion A: Conservation and Transportation and Criterion C: Design/Engineering.

054918 61392190600021	LA0010	STREAM	Concrete rigid frame	1923	State of Louisiana	Open	N/A

This bridge has significance as an important example of concrete rigid frame construction, a distinctive and rare bridge type in Louisiana. The distinguishing feature of this type of construction is the integration of substructure and superstructure into a single monolithic, cast-in-place unit, which this bridge clearly exhibits. This bridge retains good integrity and clearly conveys the significant design features within its type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

027160 05428421300071	LA0132	BOEUF RIVER	Steel High Truss (Simple Through Truss)	1926	State of Louisiana	Open	N/A
This through truss bridge has significance as an example of a distinctive truss subtype. The bridge's significant design feature is its Camelback through truss, characterized by vertical members in compression and diagonals in tension with a crossbar system in the central panel and a five-sloped polygonal top chord. The bridge was built to a state standard plan (S-H-T-4). Built in 1926, the bridge was relocated in 1966 from Bayou D'Arbonne in Union Parish to its present location carrying LA 132. This bridge exhibits replacement substructure and approach spans, resulting in a minor loss of integrity. The bridge also exhibits altered portal bracing and replacement guardrail. Despite these, the bridge is able to convey its significant design features. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering. No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.							

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

002820 02450070309182	US0061	BONNET CARRE	Concrete Deck Girder	1935	State of Louisiana	Open	N/A
This bridge has been previously determined eligible for listing in the National Register.							
002830 02458450600001	LA0631	BAYOU DESALLEMAND	Steel Plate Girder Swing Span	1935	State of Louisiana	Open	N/A

This steel plate girder swing bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with the Public Works Administration (PWA) program established by the National Industrial Recovery Act (NIRA) during the Depression-era to provide work relief and improved infrastructure. A plaque on the bridge identifies it as a federal aid project and Louisiana Highway Commission Biennial reports document that it was a Depression-era work-relief project.

This bridge also possesses significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of the steel plate girder swing type, which is characterized by steel plate girder main span, center-bearing turning mechanism, pivot pier, and operator's house. Based on as-built plans, it appears that state standard plan (S-C-105) served as a general guide for the design and construction of this bridge. This bridge has undergone several alterations, including changes to its mechanical equipment, altered windows and doors on the operator's house, and the removal of locking mechanisms important to the function of the movable span. Although this bridge is still operable, the method of operation has changed from a technologically sophisticated electronic system to a manually operated structure, which, combined with other alterations, cumulatively results in a loss of integrity and a change to the original design and engineering of the bridge under Criterion C. This bridge is not eligible for listing in the National Register under Criterion C. However, despite these alterations, the bridge does continue to convey design features that demonstrate its significance as a work of the PWA and is eligible for the National Register under Criterion A: Politics/Government.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

203760 61474260200721	LA0070	MISS RIVER/LA 18/LA 44	Steel High Truss (Cantilevered Through Truss)	1964	State of Louisiana	Open	N/A

This through truss bridge has significance as an important example of a distinctive truss subtype. Significance is demonstrated by the presence of distinctive features of the Warren through truss, which is characterized by diagonal members to withstand both tensile and compressive forces. This example has added verticals for bracing. In addition, the bridge displays innovative or complex technological solutions related to site conditions, which consist of a continuous main span and caisson construction of the piers to meet the challenges of crossing the Mississippi River. This bridge retains good integrity and clearly conveys the significant design features of the continuous Warren through truss. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

Appendix D1 - Eligible, Previously Determined Eligible, and Listed Pre-1971 Bridges

St. Landry Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
007300 03490080402331	US0190	ATCHAFALAYA FLOODWAY	Concrete Prestressed Girders	1961	State of Louisiana	Open	N/A

This prestressed concrete girder bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as an important crossing of the West Atchafalaya Floodway. In order to continue uninterrupted vehicular access over the floodplain when flooded, the state constructed six high-level bridges (in three pairs) in the 1960s to cross over the floodplain, including this bridge and its parallel structure (Recall No. 007310). This is one-half of the only remaining pair of bridges as the other two pairs were replaced in 2004-2005. This bridge and its parallel structure provided uninterrupted access across the West Atchafalaya Floodway.

Although constructed in 1961 and considered a common type, this bridge possesses exceptional engineering significance. This bridge and its parallel structure are the first prestressed concrete girder bridges constructed by the state. Plans were approved in 1958 and the bridges were constructed in 1961, during the early period of prestressed concrete use in Louisiana. This bridge retains good integrity and continues to convey design features that demonstrate its significance as a floodplain crossing and as a structure with exceptional significance within its type. This bridge is eligible for listing in the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

007310 03490080402332	US0190	ATCHAFALAYA FLDWY	Concrete Prestressed Girders	1961	State of Louisiana	Open	N/A

This prestressed concrete girder bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as an important crossing of the West Atchafalaya Floodway. In order to continue uninterrupted vehicular access over the floodplain when flooded, the state constructed six high-level bridges (in three pairs) in the 1960s to cross over the floodplain, including this bridge and its parallel structure (Recall No. 007300). This is one half of the only remaining pair of bridges as the other two pairs were replaced in 2004-2005. This bridge and its parallel structure and provided uninterrupted access over the West Atchafalaya Floodway.

Although constructed in 1961 and considered a common type, this bridge also possesses exceptional engineering significance. This bridge and its parallel structure, which is nearly identical, are the first prestressed concrete girder bridges constructed by the state. Plans were approved in 1958 and the bridges were constructed in 1961, during the early period of prestressed concrete use in Louisiana. The bridge, which carries eastbound US 190 traffic over the Atchafalaya Spillway, was widened in 1974 with the addition of a new concrete girder on the outside of the structure. However, the design and materials are sympathetic to the original bridge design and it does not detract from the integrity. Despite this alteration, this bridge retains good integrity and continues to convey design features that demonstrate its significance as a floodplain crossing and as a structure with exceptional significance within its type. This bridge is eligible for listing in the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

008120 03493800404371	LA0103	BAYOU COURTABLEAU	Concrete Deck & Bents w/ Steel I-Beam w/ Removable Span	1937	State of Louisiana	Open	N/A

This removable span bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with U.S. Works Program Highway funds to provide work relief and improved infrastructure during the Depression era. The construction of this bridge was part of New Deal federal-relief efforts. This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission biennial reports.

The bridge also possesses significance as an important variation of the steel I-beam bridge subtype. Its design features include the floor beam extensions and the open grated deck to allow for removal of the steel beam center span. It appears to follow standard plans from the 1930s. The bridge exhibits alterations to the open grate, which has been covered with pavement making it challenging to remove the span. These changes result in a major loss of integrity because the removable span no longer functions in the manner in which it was designed. As a result, the bridge is not eligible for listing in the National Register under Criterion C. However, despite these alterations, the bridge continues to convey design features that demonstrate its significance as a work of a Depression-era program and is eligible for the National Register under Criterion A: Politics/Government.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

St. Landry Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
XXXX10	LOCAL ROAD	CREEK	Steel Low Truss (Pony Truss)	1950	Parish Highway Agency	Open	N/A

This pony truss bridge has significance as an example of a distinctive truss subtype. The bridge's significant design feature is its Pratt truss, characterized by vertical members in compression and diagonals in tension with a crossbar system in the central panel. The bridge is additionally significant as a rare example of a Pratt pony truss, of which only two known examples remain in Louisiana. The truss was moved to this location c. 1985. The relocation of the truss does not diminish its ability to display significance as a Pratt truss. A railroad flatcar (c. 2011) has been placed atop fill added to both approaches and now carries the traffic approximately 2 feet above the deck of the truss structure. The flatcar's length exceeds that of the truss, and it does not come into contact with any part of the earlier structure and its placement has not resulted in any physical alteration to the truss. The flatcar functions as a separate load-carrying structure, with the Pratt truss supporting only its own weight below the flatcar. The addition of the flatcar and relocation of the truss constitutes a minor loss of integrity, as the bridge is still able to convey its significant design features. The railroad flatcar is identified under recall number 030006. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

Appendix D1 - Eligible, Previously Determined Eligible, and Listed Pre-1971 Bridges

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
008570 03500560400141	LA03361	TECHE BAYOU	Steel Vertical Lift Span	1950	State of Louisiana	Open	Yes: Breaux Bridge Historic District

This tower drive with connected towers vertical lift bridge has significance as a movable bridge and as an important variation within the vertical lift bridge type. This variation is demonstrated in the location of the drive machinery at the center of a fixed span that operates the four sheaves. This configuration is uncommon nationally and represents a variation based on the small size of the navigation channel and necessary span length. The bridge exhibits alterations to the operator's house that result in a minor loss of integrity, but continues to convey the significant design features of this variation within the vertical lift type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

008690 03502380300131	LA0096	BAYOU TECHE ST M.	Steel Plate Girder Swing Span	1942	State of Louisiana	Open	N/A

This steel plate girder swing bridge has significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of the steel plate girder swing type, which is characterized by steel plate girder main span, center-bearing turning mechanism, pivot pier, and operator's house. This particular example also features a variable-depth girder. Based on as-built plans that date to before the 1940 reorganization of the LHC into the LDH, it appears that a state standard plan (S-S-48) served as a general guide for the design and construction of this bridge. The bridge exhibits alterations to the operator's house that result in a minor loss of integrity, but continues to convey significant design features of this subtype. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

008700 03504003000331	LA0350	BAYOU TECHE PARKS	Steel Vertical Lift Span	1950	State of Louisiana	Open	N/A

This tower drive with connected towers vertical lift bridge has significance as a movable bridge and as an important variation within the vertical lift bridge type. This variation is demonstrated in the location of the drive machinery at the center of a fixed span that operates the four sheaves. This configuration is uncommon nationally and represents a variation based on the small size of the navigation channel and necessary span length. Based on as-built plans, it appears that a state standard plan (S-L-6-15) served as a general guide for the design and construction of this bridge. The bridge exhibits alterations to the operator's house that result in a minor loss of integrity, but continues to convey the significant design features of this variation within the vertical lift type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

200896 P5030169914401	LOCAL ROAD	CROCODILE BAYOU	Pontoon Bridge	1967	Parish Highway Agency	Open	N/A

This pontoon swing bridge has significance as movable bridge and as a variation within the pontoon swing bridge type. Distinctive engineering features that convey this variation include a main pontoon span with a secondary steel I-beam deck above the floating pontoon that lifts and lowers using a system of cables, six sheaves, pins, and large cylindrical counterweights. The bridge retains good integrity and clearly conveys the significant features of this variant of the pontoon swing bridge type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

008970 03510040609371	LA0182	CHARENTON	Steel High Truss (Simple Through Truss)	1941	State of Louisiana	Open	N/A

This through truss bridge has significance as an important example of a distinctive truss subtype. The bridge's significant design feature is its K-truss configuration, characterized by the arrangement of vertical and diagonal members to form a "K" in each truss panel. The K-truss is a rare variation both nationally and in Louisiana. This bridge retains good integrity and clearly conveys the significant design features of the through K- truss. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

009000 03510050100001	LA0182	ATCHAF.R/BERWICK BAY	Steel High Truss (Simple Through Truss)	1932	State of Louisiana	Open	N/A

This through truss bridge has significance as an important example of a distinctive truss subtype. The bridge's significant design feature is its K-truss configuration characterized by the arrangement of vertical and diagonal members to form a "K" in each truss panel. This bridge also appears to conform to a 1931 standard plan (SHT-29-15). The K-truss is a rare variation both nationally and in Louisiana. Significance is also demonstrated through an innovative or complex technological solution related to site conditions, consisting of the use of caisson construction of the piers to meet the challenges of crossing the Atchafalaya River at Berwick Bay. This bridge retains good integrity and clearly conveys its significant design features. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

009130 03512410209141	LA0324	BAYOU TECHE	Steel Low Truss Swing Span	1945	State of Louisiana	Open	N/A

This Warren pony truss swing bridge has significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of a pony truss swing bridge, which is characterized by the Warren truss configuration, center-bearing turning mechanism, pivot pier, and operator's house. The bridge exhibits alterations to the operator's house that result in a minor loss of integrity, but continues to convey significant design features of this subtype. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

058750 62520060800001	US0090	EAST PEARL RIVER	Steel High Truss Swing Span	1933	State of Louisiana	Open	N/A
This Parker through truss swing bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as a major river crossing that eliminated a former ferry crossing and as an integral part of the Rigolets to Pearlington shortcut between Louisiana and the Mississippi Gulf Coast. This bridge is the first vehicular crossing carrying US 90 (Old Spanish Trail) over the East Pearl River and provided the final link in a 22-mile shortcut between New Orleans and the Mississippi Gulf Coast. The construction of the bridge was part of a larger Louisiana Highway Department effort in the 1930s to upgrade the route and eliminate all ferry crossings along the route. This bridge also possesses significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of a through truss swing bridge, which is characterized by the Parker truss configuration, center-bearing turning mechanism, pivot pier, and operator's house centered above the roadway, over the pivot pier. In addition to the Parker truss swing span this bridge has two fixed Parker truss spans. This bridge appears to conform to state standard plan (S-S-54). The bridge retains good integrity and clearly conveys the design features that demonstrate its significance as a major river crossing and as a distinctive movable bridge subtype. The bridge is eligible for the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.							
058930 62520131210841	US0190	BAYOU LACOMBE	Steel Plate Girder Swing Span	1938	State of Louisiana	Open	N/A

059090 62520180400531	US0011	NO&NE RAILROAD	Concrete Deck & Bents w/ Steel I-Beam	1937	State of Louisiana	Open	N/A

This steel I-beam bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade separation structure is directly related to its funding through the U.S. Works Program Grade Crossing program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). The U.S. Works Grade Crossing Program resulted from the Emergency Relief Appropriation Act funding. This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission Biennial reports. The bridge exhibits alterations to the railing with the addition of guardrail that results in a minor loss of integrity, but continues to convey its significance as the work of the Emergency Relief Appropriation Act. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation.

No evidence was found during research or data collection activities to indicate that this bridge is an important example of bridge design, engineering, or construction. This bridge does not possess significance under Criterion C.

059730 62522800303311	LA0036	ICG RAILROAD	Concrete Deck & Bents w/ Steel I-Beam	1937	State of Louisiana	Open	N/A

This steel I-beam bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade separation structure is directly related to its funding through the U.S. Works Program Grade Crossing program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). The U.S. Works Grade Crossing Program resulted from the Emergency Relief Appropriation Act funding. This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission Biennial reports. The bridge exhibits alterations to the railing with the addition of guardrail and the addition of fabricated plate to protect the underside of the bridge that results in a minor loss of integrity, but continues to convey its significance as the work of the Emergency Relief Appropriation Act. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation.

No evidence was found during research or data collection activities to indicate that this bridge is an important example of bridge design, engineering, or construction. This bridge does not possess significance under Criterion C.

620266 P5230253900571	LOCAL ROAD	DRAIN	Metal Arch or Pipe Culvert	1936	Parish Highway Agency	Open	N/A

This culvert has significance as an important example of a multi-plate arch, which is a distinctive culvert subtype. It also possesses high artistic value associated with the Rustic style. Significance is demonstrated by its notable ornamental features, including decorative stone masonry with prominent arch rings and capstones and flared wingwalls. All exterior walls are covered with a veneer of random-coursed, ashlar stone with highly rusticated surfaces in the Rustic style. The bridge has a low parapet with rusticated stonework and prominent capstones. This culvert retains good integrity and clearly conveys its design significance as a multi-plate arch and through its overall design aesthetic. This culvert is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this culvert possesses a direct and important association with historical events or trends. This culvert does not possess significance under Criterion A.

062080 62534529000003	US0051	PASS MANCHAC	Steel I-Beam - Suspended	1957	State of Louisiana	Open	N/A

This steel I-beam bridge has exceptional significance for its early use of prestressed concrete cylinder piles. According to a Louisiana Civil Engineer article from August 2002 regarding prestressed concrete research at Tulane University, the high-level bridge carrying US 51 over Pass Menchac was a notable structure to utilize this type of pile in the 1950s. Constructed in 1957, the bridge is one of the first examples of a Louisiana bridge that utilized prestressed concrete structural elements, which began to be used nationally in the 1950s. In addition, the bridge has a notable overall length of 3,012 feet. The steel I-beam bridge with prestressed concrete cylinders retains good integrity, and despite being a common type conveys exceptional significance and is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
003240 02550659104061	LA0024	LITTLE CAILLOU	Steel Vertical Lift Span	1941	State of Louisiana	Open	N/A

This tower drive with connected towers vertical lift bridge has significance as a movable bridge and as an important variation within the vertical lift bridge type. This variation is demonstrated in the location of the drive machinery at the center of a fixed span that operates the four sheaves. This configuration is uncommon nationally and represents a variation based on the small size of the navigation channel and necessary span length. Based on as-built plans that date to before the 1940 reorganization of the LHC into the LDH, it appears that a state standard plan (S-L-6) served as a general guide for the design and construction of this bridge. The bridge exhibits alterations to the operator's house that result in a minor loss of integrity, but continues to convey the significant design features of this variation within the vertical lift type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

200850 02552459001261	LA0315	PROVOST BAYOU	Steel Plate Girder Swing Span	1953	State of Louisiana	Open	N/A

This steel plate girder swing bridge has significance as an example of a movable bridge and as an important variation within the subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of the steel plate girder swing subtype, which is characterized by steel plate girder main span, center-bearing turning mechanism, pivot pier, and operator's house. Significance is further conveyed by the manually operated turning mechanism and associated components, which are intact. This particular example also features a variable-depth girder. Guardrail has been added to the original railing and restricts the opening. Based on as-built plans, it appears that a state standard plan (S-348-15-Rev) served as a general guide for the design and construction of this bridge. The bridge retains its original manual power source and associated components, including original gears and deck access point. Despite the addition of the guardrail, the bridge continues to convey the significant design features of the subtype and this important variation. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

The bridge exhibits alterations to the original railing that result in a minor loss of integrity, but continues to convey significant design features within the swing bridge type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

018970 04600270309511	US0371	ICG RR @ SIBLEY	Concrete Deck Girder	1934	State of Louisiana	Open	N/A

This concrete deck girder bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade-separation structure is directly related to its funding through the National Industrial Recovery Act (NIRA) program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission Biennial reports. The bridge exhibits alterations to the railing that results in a minor loss of integrity, but continues to convey its significance as the work of the NIRA. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation.

No evidence was found during research or data collection activities to indicate that this bridge is an important example of bridge design, engineering, or construction. This bridge does not possess significance under Criterion C.

019040 04600270313242	US0371	KCS RR MINDEN	Concrete Deck & Bents w/ Steel I-Beam	1935	State of Louisiana	Open	N/A

This steel I-beam bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade separation structure is directly related to its funding through the U.S. Works Program Grade Crossing program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). The U.S. Works Grade Crossing Program resulted from the Emergency Relief Appropriation Act funding. This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission Biennial reports. The bridge exhibits alterations to the railing that results in a minor loss of integrity, but continues to convey its significance as the work of the Emergency Relief Appropriation Act. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation.

No evidence was found during research or data collection activities to indicate that this bridge is an important example of bridge design, engineering, or construction. This bridge does not possess significance under Criterion C.

*Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with "XXXX."

Appendix D1 - Eligible, Previously Determined Eligible, and Listed Pre-1971 Bridges

West Baton Rouge Parish

Recall No.* Structure No.	Facility Carried	Feature Crossed	Structure Type	Year Built	Owner	Status	Within/Adjacent to Known Historic District
055130 61610080102931	US0190	LA 415/M P RR @ LOBDELL	Concrete Deck & Bents w/ Steel I-Beam	1939	State of Louisiana	Open	N/A

This steel I-beam bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade-separation structure is directly related to its funding through the U.S. Works Program Grade Crossing Program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). The U.S. Works Grade Crossing Program resulted from the Emergency Relief Appropriation Act funding. This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission biennial reports.

This bridge also possesses significance in its outstanding overall architectural treatment. Its significance is derived from a combination of decorative features that together create an aesthetic distinguished within the bridge type. The bridge features decorative concrete railing, arched pier cap design, tapered brackets under the sidewalks, and geometric end posts, which as a whole conveys high artistic value. The bridge is altered with the addition of a concrete median barrier that results in a minor loss of integrity, but continues to convey design features that demonstrate its significance as a work funded through the Emergency Relief Appropriation Act and as a structure with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation and Criterion C: Design/Engineering.

055240 61610500708321	LA0001	PORT ALLEN CANAL	Steel Plate Girder - Continuous	1960	State of Louisiana	Open	N/A

This bridge with a continuous steel plate girder main span and an identical parallel span (Recall 055250) displays innovative or complex technological solutions related to site conditions, which required a longer span. The steel plate girder consists of built-up welded plates with a deep web that lies between the top and bottom flanges, which are fabricated by plate steel placed horizontally over the webs of the girder. A continuous plate girder span is uninterrupted over one or more intermediate supports, resulting in less materials and deflection and requiring additional engineering to reduce the stresses within the span. The bridge also has exceptional main span length with three continuous plate girders, consisting of two 150-foot girders and one 200-foot girder together forming a 500-foot-long span. The continuous steel plate girder bridge retains good integrity, and despite being a common type conveys exceptional significance and is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This reinforced concrete arch bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with the Works Progress Administration (WPA) program to provide work relief and improved infrastructure during the Depression era. Between 1936 and 1939 the WPA constructed eight reinforced concrete arch bridges and one rigid frame bridge in New Orleans's City Park featuring Classical Revival and Art Deco stylized influences typical of the period. Each bridge features "WPA" in Art Deco style letters in the concrete endposts. Bridge construction was part of New Deal federal-relief efforts by the WPA, Public Works Administration (PWA), Civil Works Administration (CWA), and Federal Emergency Relieve Administration (FERA) during the Depression in City Park that included reconfiguration of the park layout and landscaping, sidewalk, road, and building construction.

This bridge also possesses significance as a distinctive bridge type in Louisiana and as an important example of high artistic value. The bridge is one of nine reinforced concrete arches in City Park reflecting the characteristics of closed spandrel arch design. Its significance is further demonstrated by the overall aesthetic treatment reflective of the Art Deco style, which is expressed by geometric patterns, crowned and beveled parapets, a recessed arch ring, integrated benches, and bold font used for the WPA stamp. A bas-relief sculpture of a reclined figure, designed by sculptor Enrique Alferez, enhances this bridge's aesthetics. This bridge retains good integrity and clearly conveys the design features that demonstrate its significance as a work of the WPA and as a distinctive bridge type with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Criterion C: Design/Engineering.

WPA; Dedicated to Victor Anseman for his great devotion to the park, 1842-1904

National Register of Historic Places Evaluation:

This reinforced concrete arch bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with the Works Progress Administration (WPA) program to provide work relief and improved infrastructure during the Depression era. Between 1936 and 1939 the WPA constructed eight reinforced concrete arch bridges and one rigid frame bridge in New Orleans's City Park featuring Classical Revival and Art Deco stylized influences typical of the period. Each bridge features "WPA" in Art Deco style letters in the concrete endposts. Bridge construction was part of New Deal federal-relief efforts by the WPA, Public Works Administration (PWA), Civil Works Administration (CWA), and Federal Emergency Relieve Administration (FERA) during the Depression in City Park that included reconfiguration of the park layout and landscaping, sidewalk, road, and building construction.

The bridge also possesses significance as a distinctive bridge type in Louisiana and as an important example of high artistic value. The bridge is one of nine reinforced concrete arches in City Park reflecting the characteristics of closed spandrel arch design. Though more modest than other arches in City Park, the combination of features conveys the overall design aesthetic of the Art Deco style, which include the overall structure design, beveled piers and parapets, recessed arch ring, and bold font used for the WPA stamp. As a later example of a reinforced concrete arch in City Park, the bridge reflects the evolution of the Art Deco style as the design aesthetic became simplified and influenced by the Streamlined Moderne style. This bridge retains good integrity and clearly conveys the design features that demonstrate its significance as a work of the WPA and as a distinctive bridge type with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Criterion C: Design/Engineering.

Bridge Plaque:

Presented by Mr. and Mrs. Felix J. Dreyfous

National Register of Historic Places Evaluation:

This reinforced concrete arch has significance as a distinctive bridge type in Louisiana and as an important example of high artistic value. The bridge is one of nine reinforced concrete arches in City Park reflecting the characteristics of closed spandrel arch design. Its significance is further demonstrated by the overall aesthetic treatment reflective of the Classical Revival style, which is expressed by a curved railing with arched posts, decorative carved flowers and inscribed cartouche on the parapet, integrated lamp posts with decorative Revival style lantern, and decorative endposts with integrated concrete urns and recessed panels. This bridge retains good integrity and clearly conveys the significant design features within its type and high artistic value. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This reinforced concrete arch bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with the Works Progress Administration (WPA) program to provide work relief and improved infrastructure during the Depression era. Between 1936 and 1939 the WPA constructed eight reinforced concrete arch bridges and one rigid frame bridge in New Orleans's City Park featuring Classical Revival and Art Deco stylized influences typical of the period. Each bridge features "WPA" in Art Deco style letters in the concrete endposts. Bridge construction was part of New Deal federal-relief efforts by the WPA, Public Works Administration (PWA), Civil Works Administration (CWA), and Federal Emergency Relieve Administration (FERA) during the Depression in City Park that included reconfiguration of the park layout and landscaping, sidewalk, road, and building construction.

This bridge also possesses significance as a distinctive bridge type in Louisiana and as an important example of high artistic value. The bridge is one of nine reinforced concrete arches in City Park reflecting the characteristics of closed spandrel arch design. Its significance is further demonstrated by the overall aesthetic treatment reflective of the Art Deco style, which is expressed by geometric patterns, inscribed vertical lines, crowned and beveled parapets, a recessed arch ring, integrated lighting, and bold font used for the WPA stamp. This bridge exhibits one alteration that results in a minor loss of integrity, the replacement of an original light fixture in the parapet with a comparable style. This continues to clearly convey design features that demonstrate its significance as a work of the WPA and as a distinctive bridge type with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Criterion C: Design/Engineering.

National Register of Historic Places Evaluation:

This concrete box culvert has significance as an important example of a technological solution to particular site conditions. Significance is demonstrated by the presence of distinctive design features, which consist of a double decker, multi-unit box design. This unique design, where two rows of box culvert barrels are stacked, allowed for the relatively inexpensive culvert form to be used without flooding on the roadway. The culvert is able to convey its significant design features and is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this culvert possesses a direct and important association with historical events or trends. This culvert does not possess significance under Criterion A.

Spring Street Overpass, Federal Aid Project No. W.P.G.M 319, Constructed Under The Adminstration Of Richard W. Leche, Governor; Earl K. Long, Lieut. Governor; L.P. Abernathy, Chairman; Louisiana Highway Commission 1937

National Register of Historic Places Evaluation:

This bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade separation structure is directly related to its funding through the U.S. Works Program Grade Crossing program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). The U.S. Works Grade Crossing Program resulted from the Emergency Relief Appropriation Act funding. A plaque on the bridge identifies it as a federal aid project and this project is also documented in the Louisiana Highway Commission Biennial reports. The bridge retains good integrity and clearly conveys the significant features to demonstrate its significance as the work of the Emergency Relief Appropriation Act. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation.

No evidence was found during research or data collection activities to indicate that this bridge is an important example of bridge design, engineering, or construction. This bridge does not possess significance under Criterion C.

National Register of Historic Places Evaluation:

This steel I-beam bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade separation structure is directly related to its funding through the U.S. Works Program Grade Crossing program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). The U.S. Works Grade Crossing Program resulted from the Emergency Relief Appropriation Act funding. This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission Biennial reports. The bridge exhibits alterations to the railing with the addition of guardrail and the addition of fabricated plate to protect the underside of the bridge that results in a minor loss of integrity, but continues to convey its significance as the work of the Emergency Relief Appropriation Act. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation.

No evidence was found during research or data collection activities to indicate that this bridge is an important example of bridge design, engineering, or construction. This bridge does not possess significance under Criterion C.

National Register of Historic Places Evaluation:

This steel I-beam bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade-separation structure is directly related to its funding through the U.S. Works Program Grade Crossing Program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). The U.S. Works Grade Crossing Program resulted from the Emergency Relief Appropriation Act funding. This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission biennial reports.

This bridge also possesses significance in its outstanding overall architectural treatment. Its significance is derived from a combination of decorative features that together create an aesthetic distinguished within the bridge type. The bridge features decorative concrete railing, arched pier cap design, tapered brackets under the sidewalks, and geometric end posts, which as a whole conveys high artistic value. The bridge is altered with the addition of a concrete median barrier that results in a minor loss of integrity, but continues to convey design features that demonstrate its significance as a work funded through the Emergency Relief Appropriation Act and as a structure with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation and Criterion C: Design/Engineering.

Louisiana Highway Commission

Bridge Plaque:

Bayou Courtableau Bridge; Federal Aid Project No W.P. M.S. 811; Commissioned under the Administration of Richard W. Leche Governor Earl K. Long, Lieut. Governor L.P. Abernathy, Chairman; Louisiana Highway Commission 1937 (plaque on top of concrete incised with "Bayou Courtableau")

National Register of Historic Places Evaluation:

This removable span bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with U.S. Works Program Highway funds to provide work relief and improved infrastructure during the Depression era. The construction of this bridge was part of New Deal federal-relief efforts. This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission biennial reports.

The bridge also possesses significance as an important variation of the steel I-beam bridge subtype. Its design features include the floor beam extensions and the open grated deck to allow for removal of the steel beam center span. It appears to follow standard plans from the 1930s. The bridge exhibits alterations to the open grate, which has been covered with pavement making it challenging to remove the span. These changes result in a major loss of integrity because the removable span no longer functions in the manner in which it was designed. As a result, the bridge is not eligible for listing in the National Register under Criterion C. However, despite these alterations, the bridge continues to convey design features that demonstrate its significance as a work of a Depression-era program and is eligible for the National Register under Criterion A: Politics/Government.

National Register of Historic Places Evaluation:

This bridge has significance as an early example and variation of the concrete deck girder subtype in Louisiana. It is one of two concrete deck girder bridges constructed prior to the development of standard plans for concrete deck girders in 1922, and therefore distinctly represents early use of this bridge type in the state. This bridge retains good integrity and clearly conveys the significant design features within its type. It is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This concrete deck girder bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as an important crossing of the Morganza Floodway. This floodplain was created in the 1940s when the U.S War Department began diverting water from the Mississippi into the Atchafalaya River to prevent flooding of the lower reaches of the Mississippi River. The diversion channels and floodplains crossed existing state highways, preventing any vehicular use during periods of flooding. At the request of the federal government, the Louisiana Highway Department upgraded portions of the effected highways with high-level bridges above the floodplain. The Morganza Floodway Bridge was completed in 1945, and provided uninterrupted access over the Morganza floodplain.

This bridge also possesses significance due to its exceptional overall length. The overall length of this non-continuous, multi-span bridge is nearly 19,000 feet, far exceeding the overall length of all other concrete deck girder bridges. Substantial overall structure length typically indicates challenging site conditions, and thus this bridge is a reflection of the complexity of engineering required for spanning a long distance. The bridge retains good integrity and clearly conveys design features that demonstrate its significance as a floodplain crossing and a structure with significant design features within its type. This bridge is eligible for the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

National Register of Historic Places Evaluation:

This prestressed concrete girder bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as an important crossing of the West Atchafalaya Floodway. In order to continue uninterrupted vehicular access over the floodplain when flooded, the state constructed six high-level bridges (in three pairs) in the 1960s to cross over the floodplain, including this bridge and its parallel structure (Recall No. 007310). This is one-half of the only remaining pair of bridges as the other two pairs were replaced in 2004-2005. This bridge and its parallel structure provided uninterrupted access across the West Atchafalaya Floodway.

Although constructed in 1961 and considered a common type, this bridge possesses exceptional engineering significance. This bridge and its parallel structure are the first prestressed concrete girder bridges constructed by the state. Plans were approved in 1958 and the bridges were constructed in 1961, during the early period of prestressed concrete use in Louisiana. This bridge retains good integrity and continues to convey design features that demonstrate its significance as a floodplain crossing and as a structure with exceptional significance within its type. This bridge is eligible for listing in the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

National Register of Historic Places Evaluation:

This prestressed concrete girder bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as an important crossing of the West Atchafalaya Floodway. In order to continue uninterrupted vehicular access over the floodplain when flooded, the state constructed six high-level bridges (in three pairs) in the 1960s to cross over the floodplain, including this bridge and its parallel structure (Recall No. 007300). This is one half of the only remaining pair of bridges as the other two pairs were replaced in 2004-2005. This bridge and its parallel structure and provided uninterrupted access over the West Atchafalaya Floodway.

Although constructed in 1961 and considered a common type, this bridge also possesses exceptional engineering significance. This bridge and its parallel structure, which is nearly identical, are the first prestressed concrete girder bridges constructed by the state. Plans were approved in 1958 and the bridges were constructed in 1961, during the early period of prestressed concrete use in Louisiana. The bridge, which carries eastbound US 190 traffic over the Atchafalaya Spillway, was widened in 1974 with the addition of a new concrete girder on the outside of the structure. However, the design and materials are sympathetic to the original bridge design and it does not detract from the integrity. Despite this alteration, this bridge retains good integrity and continues to convey design features that demonstrate its significance as a floodplain crossing and as a structure with exceptional significance within its type. This bridge is eligible for listing in the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

National Register of Historic Places Evaluation:

This bridge has significance as an important example of concrete rigid frame construction, a distinctive and rare type in Louisiana. The distinguishing feature of rigid frame construction is the integration of substructure and superstructure components into a single cast-in-place unit, which this bridge clearly exhibits. The small sections of the historic concrete railing that are missing result in only a minor loss of integrity, as the bridge continues to convey the significant design features of its type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

WPA

Bridge Plaque:

WPA

National Register of Historic Places Evaluation:

This concrete rigid frame bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with the Works Progress Administration (WPA) program to provide work relief and improved infrastructure during the Depression era. Between 1936 and 1939 the WPA constructed eight reinforced concrete arch bridges and one rigid frame bridge in New Orleans's City Park featuring Classical Revival and Art Deco stylized influences typical of the period. Each bridge features "WPA" in Art Deco style letters in the concrete endposts. Bridge construction was part of New Deal federal-relief efforts by the WPA, Public Works Administration (PWA), Civil Works Administration (CWA), and Federal Emergency Relieve Administration (FERA) during the Depression in City Park that included reconfiguration of the park layout and landscaping, sidewalk, road, and building construction.

This bridge also possesses significance as an important example of concrete rigid frame construction, a distinctive and rare bridge type in Louisiana, and for possessing high artistic value. The distinguishing feature of rigid frame construction is the integration of substructure and superstructure into a single monolithic, cast-in-place unit, which this bridge clearly exhibits. In addition, this bridge displays architectural treatments and decorative elements that convey the overall design aesthetic of the Art Deco style and make the structure visually distinctive in its urban parkway setting. This includes the haunched span, vertical ribbing and flutes on the posts, curved end walls, and bold font used for the WPA stamp. This bridge retains good integrity and clearly conveys the design features that demonstrate its significance as a work of the WPA and as a distinctive bridge type with high artistic value. This bridge is eligible for the National Register under Criterion A: Politics/Government and Criterion C: Design/Engineering

National Register of Historic Places Evaluation:

This bridge has significance as an important variation of concrete slab construction. This bridge features pier caps that are integrated into the concrete slab superstructure, which results in a monolithic design and represents a distinctive variation within the type. Although the original concrete railings have been replaced with metal guard rails that results in a minor loss of integrity, the bridge continues to convey the significant design features of its type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This concrete girder bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Conservation as a bridge that is part of an integrated spillway structure (overbank structure) that was constructed as part of a larger conservation effort. The bridge and spillway were constructed to prevent the Mississippi River from diverting into the Atchafalaya River, which could dramatically change the landscape in south-central and southeastern Louisiana, as well as displace communities and industries served by the rivers. This bridge and spillway are also related to managing flooding within the region. This bridge is one of two spillways (the other bridge integrated with a spillway is recall number F15321) and a navigational canal that make up the larger Old River Control Structure.

Although constructed in 1959 and considered a common type, this bridge also possesses exceptional significance for its distinctive engineering and design features. The bridge is part of an integrated spillway structure that spans 3,504 feet. Significant engineering went into this bridge, which incorporates two different components: a vehicular bridge with a notable overall span length to span the water feature and a spillway structure that consists of a series of flood control gates that control a large quantity of water. The bridge retains good integrity and clearly conveys design features that demonstrate its significance as an integrated structure that is part of a larger conservation effort and as distinctive example of engineering. The bridge is eligible for the National Register under Criterion A: Conservation and Criterion C: Design/Engineering.

National Register of Historic Places Evaluation:

This culvert has significance as an important example of a multi-plate arch, which is a distinctive culvert subtype. It also possesses high artistic value associated with the Rustic style. Significance is demonstrated by its notable ornamental features, including decorative stone masonry with prominent arch rings and capstones and flared wingwalls. All exterior walls are covered with a veneer of random-coursed, ashlar stone with highly rusticated surfaces in the Rustic style. The bridge has a low parapet with rusticated stonework and prominent capstones. This culvert retains good integrity and clearly conveys its design significance as a multi-plate arch and through its overall design aesthetic. This culvert is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this culvert possesses a direct and important association with historical events or trends. This culvert does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This pontoon swing bridge has significance as a distinctive example of a movable bridge. Its significance is demonstrated by the presence of distinctive engineering and design features of the pontoon swing bridge type, which is characterized by a floating pontoon span, pivot arm, and mechanical systems to operate the movement of the pontoon and approach aprons. The bridge exhibits alterations to the operator's house and railing that result in a minor loss of integrity, but continues to convey the significant design features of the type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This pontoon swing bridge has significance as movable bridge and as a variation within the pontoon swing bridge type. Distinctive engineering features that convey this variation include a main pontoon span with a secondary steel I-beam deck above the floating pontoon that lifts and lowers using a system of cables, six sheaves, pins, and large cylindrical counterweights. The bridge retains good integrity and clearly conveys the significant features of this variant of the pontoon swing bridge type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This through truss bridge has significance as an important example of a distinctive truss subtype. It conveys its engineering significance through the use of a K-truss configuration characterized by the arrangement of vertical and diagonal members to form a “K” in each truss panel. In addition, the bridge displays innovative or complex technological solutions related to its site conditions, which consist of an arched cantilever main span and caisson pier construction to meet the challenges of crossing the Red River. The K-truss is a rare variation both nationally and in Louisiana; this bridge is the only example in Louisiana to also incorporate a cantilevered span. This bridge exhibits added beam guard, resulting in a minor loss of integrity, but is able to convey the significant design features of the through K-truss. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

Louisiana Department of Highways

Bridge Plaque:

None

National Register of Historic Places Evaluation:

This Warren through truss bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as a major river crossing that eliminated a former ferry crossing. The bridge is the first vehicular crossing of the Red River at this location. The bridge was constructed by the Louisiana Department of Highways in 1952 to provide uninterrupted east-west highway through the northern portion of Louisiana. Carrying LA 2, this bridge constitutes the only crossing of the Red River in Louisiana north of Shreveport.

This bridge also possesses significance as an example of a distinctive truss bridge subtype. Significance is demonstrated by the presence of distinctive features of the Warren through truss, consisting of five spans characterized by diagonal members to withstand both tensile and compressive forces. This example has added verticals for bracing. This bridge was built to a state standard plan (SHT-35-15). This bridge exhibits an added concrete guardrail, resulting in a minor loss of integrity, but continues to clearly convey design features that demonstrate its significance as a major river crossing and as a distinctive truss bridge subtype. This bridge is eligible for the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

National Register of Historic Places Evaluation:

This through truss bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as an important local crossing. The Cane River Bridge, constructed in 1912, replaced an earlier ferry and provided a crossing that allowed more reliable access to railroad connections for the community that had previously been interrupted by flooding.

The bridge also possesses significance as an important example of a distinctive subtype of truss bridge and for its method of construction. The distinctive features that convey its engineering significance are its three Pratt truss spans, which are characterized by vertical members in compression and diagonals in tension with a crossbar system in the central panel. The Cane River Bridge displays pinned primary connections; this construction method is only found on early bridges of which only two examples were identified statewide. This bridge exhibits a replacement substructure and added guardrail, resulting in a minor loss of integrity, but continues to convey design features that demonstrate its significance as an essential local river crossing and as an important truss bridge subtype with a distinctive method of construction. This bridge is eligible for the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

Design and Construction Data:

Engineer or Builder:

Wisconsin Bridge & Iron Company

Bridge Plaque:

Wisconsin Bridge and Iron Company, Milwaukee, Wis. 1933

National Register of Historic Places Evaluation:

This Parker through truss swing bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as a major river crossing that eliminated a former ferry crossing and as an integral part of the Rigolets to Pearlington shortcut between Louisiana and the Mississippi Gulf Coast. This bridge is the first vehicular crossing carrying US 90 (Old Spanish Trail) over the East Pearl River and provided the final link in a 22-mile shortcut between New Orleans and the Mississippi Gulf Coast. The construction of the bridge was part of a larger Louisiana Highway Department effort in the 1930s to upgrade the route and eliminate all ferry crossings along the route.

This bridge also possesses significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of a through truss swing bridge, which is characterized by the Parker truss configuration, center-bearing turning mechanism, pivot pier, and operator's house centered above the roadway, over the pivot pier. In addition to the Parker truss swing span this bridge has two fixed Parker truss spans. This bridge appears to conform to state standard plan (S-S-54). The bridge retains good integrity and clearly conveys the design features that demonstrate its significance as a major river crossing and as a distinctive movable bridge subtype. The bridge is eligible for the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

National Register of Historic Places Evaluation:

This Warren through truss swing bridge has significance as an important example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of a through truss swing bridge, which is characterized by the Warren truss configuration, center-bearing turning mechanism, pivot pier, and operator's house centered above the roadway, over the pivot pier. The bridge exhibits alterations to the original railing that result in a minor loss of integrity, but continues to convey significant design features within the swing bridge type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This steel I-beam bridge has exceptional significance for its early use of prestressed concrete cylinder piles. According to a Louisiana Civil Engineer article from August 2002 regarding prestressed concrete research at Tulane University, the high-level bridge carrying US 51 over Pass Menchac was a notable structure to utilize this type of pile in the 1950s. Constructed in 1957, the bridge is one of the first examples of a Louisiana bridge that utilized prestressed concrete structural elements, which began to be used nationally in the 1950s. In addition, the bridge has a notable overall length of 3,012 feet. The steel I-beam bridge with prestressed concrete cylinders retains good integrity, and despite being a common type conveys exceptional significance and is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This continuous steel rolled I-beam bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. The significance of this grade-separation structure is directly related to its funding through the National Industrial Recovery Act (NIRA) program during the Depression-era to provide safe railroad-highway crossings. In the 1930s, increased attention was given to creating grade separations between railway lines and roads and specific legislation was passed to provide funds for highway-rail grade separations through the NIRA (1933), Hayden Cartwright Act (1934), and Emergency Relief Appropriation Act (1935). This bridge's association with a federal Depression-era program is documented in the Louisiana Highway Commission biennial reports.

The bridge also possesses significance as a variation within this otherwise common bridge type. This bridge consists of three beams spanning uninterrupted over intermediate piers that together form a 181-foot-long continuous span. The presence of a significant main span length represents an innovative or complex solution related to site conditions, which was required to cross a railroad corridor and topography. The bridge exhibits alterations to the substructure with the addition of bent supports that results in a minor loss of integrity, but continues to convey its design features that demonstrate its significance as a structure funded through the NIRA and as a distinctive variation within the bridge type. This bridge is eligible for the National Register under Criterion A: Politics/Government and Transportation and Criterion C: Design/Engineering.

National Register of Historic Places Evaluation:

This pony truss bridge has significance as an example of a distinctive truss subtype. The bridge's significant design feature is its Pratt truss, characterized by vertical members in compression and diagonals in tension with a crossbar system in the central panel. The bridge is additionally significant as a rare example of a Pratt pony truss, of which only two known examples remain in Louisiana. The truss was moved to this location c. 1985. The relocation of the truss does not diminish its ability to display significance as a Pratt truss. A railroad flatcar (c. 2011) has been placed atop fill added to both approaches and now carries the traffic approximately 2 feet above the deck of the truss structure. The flatcar's length exceeds that of the truss, and it does not come into contact with any part of the earlier structure and its placement has not resulted in any physical alteration to the truss. The flatcar functions as a separate load-carrying structure, with the Pratt truss supporting only its own weight below the flatcar. The addition of the flatcar and relocation of the truss constitutes a minor loss of integrity, as the bridge is still able to convey its significant design features. The railroad flatcar is identified under recall number 030006. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

Main Span Configuration (if applicable): Pony truss swing span (Warren)

Maximum Span Length (feet): 75

Number of Spans: 1

Overall Structure Length (feet): 227

Approach Span Type (if applicable): Timber stringer/multi-beam or girder

Posted Load:

Current ADT: 000210

Design and Construction Data:

Engineer or Builder:

Unknown

Bridge Plaque:

Fabricated and [Built By] Daniel Jeffrey and Sons, Inc., Boiler Tank and Structural Steel [illegible]

National Register of Historic Places Evaluation:

This pony truss swing bridge has significance as an example of a movable bridge, as well as an important variation within the swing bridge type. Distinctive features that demonstrate this variation include its variable-depth Warren truss superstructure configuration with separate trusses for each swing arm, connected with pinned horizontal members. Its significance is further demonstrated in its manually operated swing mechanism, which is an important variation within the type. The bridge retains good integrity and clearly conveys the significant design features of this variation within the bridge type. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This Warren pony truss swing bridge has significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of a pony truss swing bridge, which is characterized by the Warren truss configuration, center-bearing turning mechanism, pivot pier, and operator's house. The bridge exhibits alterations to the operator's house that result in a minor loss of integrity, but continues to convey significant design features of this subtype. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This continuous steel plate girder main span displays innovative or complex technological solutions related to site conditions, which required a longer span. The steel plate girder consists of built-up welded plates with a deep web that lies between the top and bottom flanges, which are fabricated by plate steel placed horizontally over the webs of the girder. A continuous plate girder span is uninterrupted over one or more intermediate supports, resulting in less materials and deflection and requiring additional engineering to reduce the stresses within the span. The bridge also has exceptional main span length with three continuous plate girders, consisting of two 150-foot girders and one 200-foot girder together forming a 500-foot-long span. The continuous steel plate girder bridge retains good integrity, and despite being a common type conveys exceptional significance and is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This bridge has four main plate girder spans: two are 150 feet and two are 175 feet, which are considered exceptional main span lengths for steel plate girder bridges. Steel plate girders consist of built-up welded plates with a deep web that lies between the top and bottom flanges, which are fabricated by plate steel placed horizontally over the webs of the girder. The bridge piers also display innovative or complex technological solutions related to geometric constraints. The main span features framed steel pier caps, with tapered steel plate girders that frame into the steel piers, which are attached to the concrete foundations by hold-down anchors that resist uplift for loads on the pier. The bearings consist of semi-circular castings supported in steel U-shaped steel supports that are bolted to the stiffeners of the pier cap. The narrow configuration of the pier, along with the fabricated steel construction of the pier shaft and cap and the hold-down anchor attachments to the concrete foundations, further lend to the engineering complexity of this bridge. In addition, the framing system allows for a lower vertical profile for the bridge and provides for a reduced “footprint” for the piers. The bridge retains good integrity, and despite being a common type conveys exceptional significance and is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This steel plate and concrete girder bridge has five main plate girder spans. Two are 150 feet and three are 200 feet, which are considered exceptional main span lengths for steel plate girder bridges. Steel plate girders consist of built-up welded plates with a deep web that lies between the top and bottom flanges, which are fabricated by plate steel placed horizontally over the webs of the girder. The bridge also has a notable overall length of 5,702 feet. The bridge retains good integrity, and despite being a common type conveys exceptional significance and is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This double-leaf trunnion bascule bridge with steel plate girder spans has significance as a distinctive example of the bascule type. Its significance is demonstrated by the presence of distinctive engineering and design features of the double-leaf trunnion bascule bridge type, which is characterized by two opposing leaves that rotate around trunnions, racks and pinions for moving each span, counterweights that descend into enclosed pits, and locking mechanisms that enable the cantilevered spans to withstand live loads and remain stable when in closed position. The bridge exhibits alteration to the operator's house that results in a minor loss of integrity, but continues to convey significant design features of this bridge type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

Bethlehem Steel Bridge Corporation

Bridge Plaque:

Strauss Trunnion Bascule Bridge, Patented, Bethlehem Steel Bridge Corporation, 1919

National Register of Historic Places Evaluation:

This Strauss trunnion bascule bridge with truss superstructure has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Transportation as an important crossing built to span the Industrial Canal in New Orleans. The canal opened in 1923 to connect Lake Pontchartrain with the Mississippi River and allows access for cargo ships and barges to river wharves. Completed in 1919, this is one of the four original bascule bridges built to cross the canal (three are extant).

The bridge also possesses significance as a distinctive subtype within the bascule bridge type. Distinctive engineering features include its heel trunnion patented design. The bridge was also engineered with a truss superstructure to carry rail and vehicular traffic over the Industrial Canal, features that further convey its engineering and design significance. The bridge exhibits alterations with the removal of railroad tracks and deck replacement that result in a minor loss of integrity, but continues to convey design features that demonstrate its significance as an important crossing along New Orleans' Industrial Canal and as a distinctive bascule bridge subtype. This bridge is eligible for the National Register under Criterion A: Transportation and Criterion C: Design/Engineering.

National Register of Historic Places Evaluation:

This steel plate girder swing bridge has significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of the steel plate girder swing type, which is characterized by steel plate girder main span, center-bearing turning mechanism, pivot pier, and operator's house. The bridge exhibits alterations to the operator's house that result in a minor loss of integrity, but continues to convey significant design features of this subtype. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This steel plate girder swing bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated through its association with the Public Works Administration (PWA) program established by the National Industrial Recovery Act (NIRA) during the Depression-era to provide work relief and improved infrastructure. A plaque on the bridge identifies it as a federal aid project and Louisiana Highway Commission Biennial reports document that it was a Depression-era work-relief project.

This bridge also possesses significance as an example of a movable bridge and as a subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of the steel plate girder swing type, which is characterized by steel plate girder main span, center-bearing turning mechanism, pivot pier, and operator's house. Based on as-built plans, it appears that state standard plan (S-C-105) served as a general guide for the design and construction of this bridge. This bridge has undergone several alterations, including changes to its mechanical equipment, altered windows and doors on the operator's house, and the removal of locking mechanisms important to the function of the movable span. Although this bridge is still operable, the method of operation has changed from a technologically sophisticated electronic system to a manually operated structure, which, combined with other alterations, cumulatively results in a loss of integrity and a change to the original design and engineering of the bridge under Criterion C. This bridge is not eligible for listing in the National Register under Criterion C. However, despite these alterations, the bridge does continue to convey design features that demonstrate its significance as a work of the PWA and is eligible for the National Register under Criterion A: Politics/Government.

Design and Construction Data:

Engineer or Builder:

Louisiana Department of Highways

Bridge Plaque:

None

National Register of Historic Places Evaluation:

This steel plate girder swing bridge has significance as an example of a movable bridge and as an important variation within the subtype. Its significance is demonstrated by the presence of distinctive engineering and design features of the steel plate girder swing subtype, which is characterized by steel plate girder main span, center-bearing turning mechanism, pivot pier, and operator's house. Significance is further conveyed by the manually operated turning mechanism and associated components, which are intact. This particular example also features a variable-depth girder. Guardrail has been added to the original railing and restricts the opening. Based on as-built plans, it appears that a state standard plan (S-348-15-Rev) served as a general guide for the design and construction of this bridge. The bridge retains its original manual power source and associated components, including original gears and deck access point. Despite the addition of the guardrail, the bridge continues to convey the significant design features of the subtype and this important variation. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This steel stringer bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Conservation as a bridge that is part of an integrated spillway structure (overbank structure) that was constructed as part of a larger conservation effort constructed as part of a larger conservation effort. The bridge and spillway were constructed to prevent the Mississippi River from diverting into the Atchafalaya River, which could dramatically change the landscape in south-central and southeastern Louisiana, as well as displace communities and industries served by the rivers. This bridge and spillway is also related to managing flooding within the region. This bridge is one of two spillways (the other bridge with integrated spillway is Recall No. F15771), and navigational canal that make up the larger Old River Control Structure.

Although constructed in 1959 and considered a common type, this bridge possesses exceptional significance for its distinctive engineering and design features. The bridge is part of an integrated spillway structure that spans 977 feet. Significant engineering went into this bridge, which incorporates two different components: a vehicular bridge and a spillway structure that consists of a series of flood control gates that control a large quantity of water. The bridge exhibits alterations that result in a minor loss of integrity, including reconstruction of a wing wall and riprap to prevent scouring under the spillway after it collapsed during the Flood of 1973. The bridge continues to convey design features that demonstrate its significance as an integrated structure that is part of a larger conservation effort and as a distinctive example of engineering. The bridge is eligible for the National Register under Criterion A: Conservation and Criterion C: Design/Engineering.

National Register of Historic Places Evaluation:

This tower drive with connected towers vertical lift bridge has significance as a movable bridge and as an important variation within the vertical lift bridge type. This variation is demonstrated in the location of the drive machinery at the center of a fixed span that operates the four sheaves. This configuration is uncommon nationally and represents a variation based on the small size of the navigation channel and necessary span length. The bridge retains good integrity and clearly conveys the significant design features of this variation within the bridge type. The bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

This tower drive vertical lift bridge with Warren through truss main span has significance as a movable bridge and as an important variation within the vertical lift bridge type. Distinctive engineering features that convey this variation include the location of two separate motor and drive mechanisms, which power the two sheaves on each tower. The bridge exhibits in-kind replacement of stringers and the grid deck and alterations to the operator's house that result in a minor loss of integrity, but continues to convey significant design features of this variation within the vertical lift type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This tower drive vertical lift bridge has significance as a movable bridge and as an important variation within the vertical lift bridge type. Distinctive engineering features that convey this variation include the location of two separate motor and drive mechanisms, which power the two sheaves on each tower. This bridge appears to conform to a state standard plan (SL50-150-28). The bridge exhibits alterations to the operator's house and replacement of isolated mechanical components and counterweight ropes that results in a minor loss of integrity, but continues to convey the significant design features of this variation within the vertical lift type. This bridge is eligible for listing in the National Register under Criterion C: Design/Engineering.

No evidence was found during research or data collection activities to indicate that this bridge possesses a direct and important association with historical events or trends. This bridge does not possess significance under Criterion A.

National Register of Historic Places Evaluation:

This tower drive with connected towers vertical lift bridge has significance for its association with important trends or events that have made a significant contribution to the broad patterns of Louisiana history. Its significance is demonstrated in the area of Conservation and Transportation as a vertical lift structure over the Old River Navigation Canal. The bridge and canal were constructed as part of a larger conservation effort to ensure in the late 1950s the Mississippi River would not divert into the Atchafalaya River. The canal was constructed to provide passage of waterway traffic between the Mississippi River and the Atchafalaya River, while the bridge carries LA 15 over the canal. The vertical lift configuration allowed for necessary navigational clearance under the bridge. The bridge and canal are associated with two spillways (related bridges are Recall Nos. F15771 and F15321) that make up the larger Old River Control Structure.

The bridge also possesses significance as a movable bridge and as an important variation within the vertical lift bridge type. This variation is demonstrated in the location of the drive machinery at the center of a fixed span that operates the four sheaves. This configuration is uncommon nationally and represents a variation based on the small size of the navigation channel and necessary span length. The bridge retains good integrity and clearly conveys design features that demonstrate its significance as an integral component of a larger conservation project and as a variation within the vertical lift bridge type. This bridge is eligible for the National Register under Criterion A: Conservation and Transportation and Criterion C: Design/Engineering.

052350 61172540103121	LA0037	LA 37 OVER US 61	Concrete Prestressed Girders	1968	State of Louisiana	N/A
No evidence was found during research or data collection activities to indicate that this post-1945 concrete or steel beam, girder or culvert bridge exhibits exceptional design, engineering, or construction or that it possesses a direct and important association with historical events or trends of exceptional importance. This bridge does not possess significance under the National Register Criteria for Evaluation and is not eligible for listing under Criteria A and C.						

*The not eligible determination is for the bridge only. Consideration of the bridge as part a potential historic district and impacts to archeological properties still need to be addressed as part of Section 106 review. Bridges located within a previously determined eligible or listed historic district are identified to assist with project planning.
**Structure number only is shown for federally-owned bridges without a LADOTD recall number; off-system bridges not owned by LADOTD or a federal agency are assigned a number beginning with “XXXX.”

*Appendix E - Not Eligible Pre-1971 Bridges**
